CHAPTER 1

INTRODUCTION TO SOCIAL WELFARE

1. DEFINITION

The Encyclopaedia of **Social Work**, elaborates the following definition:

"Social welfare is an organized effort to ensure a basic standard of decency in relation to the physical and material well-being of the citizenry"

Walter Friedlander asserted the following definition:

"Social welfare is the organized system of social services and institutions, designed to aid individuals and groups to attain satisfying standards of life and health. It aims at personal and social relationships which permit individuals the development of their full capacities and the promotion of their well-being in harmony with the needs of the community."

Martin and Zald define it as: Our definition of social welfare is relatively exclusive:

"Social Welfare attempts to enable people in need to attain a minimum level of social and personal functioning."

Wickenden *interprets Social Welfare as: "including those laws, programmes, benefits, and services which assure or strengthen provisions for meeting social needs recognized as basic to the well-being of the population and the better functioning of the social order."*

Eventually, **Rischer** notes that Social Welfare is broader than physical and material welfare. It also deals with people's relations with each other and their personal and close range interactions (family contacts, professional interactions, friendships and other human relationships), which are key aspects of well-being. Therefore, this means of defining social welfare includes services such as recreation, socialization, and counselling.

Most of the authors agree that this definition — Social Welfare as laws, services, and programmes designed to bring people's level of well-being upto some minimum — offers a fairly adequate description. By and large it meets the tests of being inclusive as well as exclusive.

2. A FUNCTIONAL DEFINITION OF SOCIAL WELFARE

Professor Philip R. Popple gives the following functional definition of Social Welfare:

For society to survive, individuals must function as interdependent units, each carrying out the full range of his or her roles and responsibilities. A society cannot survive if it contains too

Scanned with CamScanner

many individuals who cannot function in an interdependent manner (who are dependent). On the other hand, the social system cannot endure if it contains too many dysfunctional culture patterns and an inefficient structure that inhibits people's ability to function in an interdependent manner.

Until the late 19th century, the basic institutions of family, economy, religion, and politics were able to handle the problem of dependency. It should be noted that when we say that these institutions handled the problem of dependency we do not mean to imply that they handled it well. People were poor, sick, mentally ill, and starving to death. Dependent people were relatively few in number, were spread out, and the basic institutions were able to do enough to prevent them from constituting a threat to the stability of the society. As society evolved from rural-agricultural to urban-industrial, these institutions lost the ability to handle dependency. When society recognized dependency as a threatening state of affairs, social welfare as an institution began to emerge to handle dependence and to facilitate interdependence.

Throughout the 20th century, we have seen a steady movement from a residual approach towards an institutional approach to social welfare. Unemployment insurance recognizes that everyone is at risk of facing periods of unemployment and a provision must be made to help people deal with this "normal" problem of modern industrial life. Old Age, Survivors and Disability Insurance (social security) recognizes three major hazards of living in an urban society and depending on a pay check and these are once again, viewed as "normal." In other words, "normal" people will need help.

3. Approaches to Social Welfare

The term 'social welfare' in fact acknowledges the existence of deprivation in society and expresses a desire to do something about it rather than wondering about the how and why of the problem. Hence, the absence of theoretical and analytical literature on social welfare. This then creates the need to evolve a theoretical framework for the study of social welfare in Pakistan.

It is worth exploring why the existing literature on social welfare has failed to develop a theoretical perspective for the understanding of the issues which remain the central concerns of social welfare. Let us now look at the different approaches to the study of social welfare.

Social thinkers have identified five approaches to the study of social welfare, namely:

- Welfare as social reform,
- Social welfare as citizenship,
- Convergence theory or technological determinism,
- The functionalist view of social welfare, and
- The Marxian perspective of social welfare.

i. Social welfare as social reform

The pragmatic approach to social welfare is represented by the work of such scholar reformers as Titmus, who follow in the footsteps of Webbs, Beveridge and others. They apply an interventionist approach with a national focus, whereby problems and policies of a particular country are analysed in the context of specific concerns of social welfare. The problem of poverty remains a focal point in social reform. A democratic state is expected to assume the responsibility of institutionalizing welfare rather than treating it as residual. The approach does not give much thought to the structural constraints. It simply advocates collecting data about relevant social

Scanned with CamScanner

maladies and the acceptance of the moral responsibility of maintaining minimum standards of welfare on the part of the state.

ii. Social welfare as citizenship

Marshall (1963) related the development of social services basically to the development of citizenship rights in the modern democratic states. These rights, according to Marshall consist of three different elements — civil, political and social. The first refers broadly to individual liberty and equality before the law; the second to political enfranchisement i.e. the right to vote; and the third consists of economic welfare, security and the right to have a civilized existence according to the standards prevailing in the society.

The first led to the establishment of legal institutions, the second to political institutions and the third to the institutionalization of social welfare. This concept of social welfare refers only to statutory welfare alone and does not account for other forms such as voluntary and charitable welfare.

iii. Convergence theory of social welfare

The convergence theory of social welfare emphasized the role of industrialization in shaping the institutions of social welfare. The theory tries to explain the nature and development of the social institutions of industrial societies in terms of the 'pull' factor (requirements of functional necessities) and the 'push' factor (consequences) of an industrial technology and economy. Consequent upon industrialization, urbanization gives rise to problem of public health, housing and control of urban environment. These changes give rise to occupational mobility and traditional agencies such as extended family and local community become weak or disintegrate. This in turn calls for alternative arrangements for looking after the needs of children, the sick and the aged. Thus specialized welfare agencies develop in response to these needs. The 'logic' of industrialism constrains advance industrial societies towards a common institutional pattern.

iv. The functionalist view of social welfare

Parson, Merton and Smelser are leading exponents of modern functionalism. Parson has suggested that the survival of a society (or any social system) depends upon four functional requirements: adaptation, goal attainment, integration and pattern maintenance. The first refers to economic tasks; the second to political one; the third is concerned with maintaining harmony and solidarity; and fourth with the continuation of basic value patterns. For Parson these are the basic functional elements (sub-systems) of a society. A particular social organization (a school, a hospital) or a social institution (educational or religious) may be concerned primarily with one of these tasks but most institutions are involved in all four.

Welfare, according to the functionalists, primarily belongs to the third, the integrative sub-system. Integration — the process which makes a social system more cohesive and the relation between the component parts more harmonious — is of two kinds: system integration and social integration. The former refers to integration of institutions, the later to that of social groups. Thus functionalist theory suggests that social welfare institutions are both a cause as well as a consequence of community. This communal character of welfare is evident in its underlying principle, namely that individuals have a claim on the community's resources not because they have 'earned' it but because solidarity demands that their wants be recognized and met.

Scanned with CamScanner

v. The Marxist perspective

Marx conceives welfare as a social norm based on the values of solidarity and cooperation. For Marx the central fact about society is its mode of production which exerts a decisive influence on the structure and processes of society. A small minority owns the means of production, while the vast majority is condemned to labour and to live at a subsistence level. Under the capitalist mode of production, the basic structural elements through which wealth and poverty are generated and reproduced are: (i) private ownership of the means of production; (ii) production for profit; (iii) private property and inheritance; and (iv) the allocation of incomes and resources through the market mechanism. For Marx these core institutions of capitalism and the underlying values constitute the very antithesis of a welfare society and thus the values and norms of welfare cannot make much headway in a capitalist society. For the institutionalization of welfare as a central social value, it is necessary that production be governed by social criteria and distribution by human needs. This requires curbing the dominance of the market, private ownership of productive resources and production for profit.

The state, in a capitalist society serves the interest of the dominant class and it largely functions to maintain the integrity of the system. Marx cites the example of the ineffectiveness of social legislation, whereby the state only acts to pass legislation but does not exert itself towards its implementation.

Thus, the work of early social thinkers indicates that they may not have paid exclusive attention to the problem of welfare provisions in a society, yet their thoughts have a bearing on the issue. It may be helpful to analyse their views on the societal arrangements, in particular the role of state in assuming a primary responsibility for the provision of welfare services.

The role of state, as is evident from an analysis of present day modern societies, has emerged as one of the important factors in determining the nature of social services in the society.

4. Scope of Social Work/Welfare in Pakistan

i. Services for the people

In the existing society, social work yields many services for the people, especially children, women, disabled persons, destitute and dependents through voluntary and public social welfare agencies.

ii. Major activities

Professor Friedlander classifies the major activities in the field of social work as public assistance, social insurance, family services, child welfare services, health and medical services, mental hygiene services, correctional services, youth leisure-time services, veteran's employments services, housing services, community welfare services, and international social services.

iii. Increasing demand in Pakistan

The scope of social work, in Pakistan, is gradually expanding with the increasing demand for such services and the availability of trained social workers in the field. In the 6th Five-Year Plan (1983-88) issued on behalf of the Planning Commission, Government of Pakistan, these services have been mentioned as follows: child welfare, family welfare, women's welfare,

Scanned with CamScanner

welfare of the physically and mentally handicapped, welfare of the aged, correctional services, community welfare services, staff welfare services, medical social work, social security, labour welfare and youth welfare.

iv. International scope

Social work is also international in scope. At the international level it includes the direction, supervision and administration of welfare service provided by international agencies such as W.H.O., I.L.O., the U.N. Technical Assistance Programme, the International Conference of Social Work, the World Federation of Mental Health and the International Red Cross Committee.

v. Acceptance of social responsibility

Social work recognizes its responsibility with regard to the adjustment between the individual and society. Social work deals with the social problems that prevent the development of healthy social life. Social work aims to establish a harmonious relationship between the individual and the society. It is due to the acceptance of this principle; social work has assumed the status of a profession.

vi. Acceptance of individual's dignity

Individual occupies paramount importance. His interests and aspirations are entirely dependent on the society. Without individual progress, social progress has no meaning. Thus like other professions, social work also accepts the dignity of the individual.

vii. Based on the scientific methods and techniques

Social work provides assistance to the individual, group and community. It requires certain professional standards and in recent years, it has evolved its own techniques. Social workers are now being trained accordingly and with the availability of such training, social work has become a full-fledged profession.

viii. Professional training

Firstly, that very work should be adopted by the workers as their career. Secondly, the workers pursuing that work should make it their source of living. Both these characteristics are evident in the modern social work.

ix. Combination of science and art

Social work in its modern form has its own theoretical principles and practical skills. As theory, social work discovers the laws of human behaviour, nature and extent of individual and social problems and the ways of solution and prevention. In practice, social work uses its skills and techniques for the solution of social problems. According to Prof. Friedlander, social work is both science and art. Thus social work is not merely a science. It is one of the most important professions which are recognized at the national and international levels.

5. PERSPECTIVES ON SOCIAL WELFARE

In this chapter we have developed the definition of social welfare as an institution that serves the function of managing the problem of dependency in society. This is the view of liberals who agree that social welfare has become a major social institution. On the contrary, conservatives argue that it is (or should be) a residual function of other institutions. Two targets for social welfare intervention have been identified: individual role performance and the functioning of social institutions. Conservatives think that the individual should be almost exclusively the target of services, but liberals are much more willing to support strategies for institutional change. Liberals believe that social welfare has become a first line social institution. Society, they argue, has become so fragmented and so complex, and the traditional institutions have deteriorated to such a point that very few individuals can function in a totally interdependent manner without some help. Employment services, family counselling, mental health and day care are all necessary supports for life in modern society.

Individual problems in role performance are a result of an interaction between individual and institutional causes. Thus, social welfare has two targets - individual change through counselling, therapy, education and training; and social change through environmental manipulation, social planning and social action. Social work, like other professions, contains conflict and diversity although social work is probably broader and more diverse than most. One internal debate centres on whether dependency is caused by individual or broad social factors. Out of this debate has arisen a dual focus on individual and social change, and on the personal and the environmental factors in social problems. The liberal perspective expresses this duality most clearly. Even at the conservative end of the continuum, however, social workers acknowledge some degree of external influence on individual difficulties.

This consciousness of interrelatedness between what C.W. Mills terms "private troubles" and "public issues" is one of social work's greatest strengths. In fact, this sense of the tie between individual and environment constitutes the profession's major contribution to the social welfare arena.

CHAPTER 2

HISTORICAL PERSPECTIVE OF SOCIAL WELFARE IN PAKISTAN

Before establishment of Pakistan, every aspect of our culture was predominated by humanitarian philosophy. Political dependency and economic backwardness have been the main obstacles in the development of social work in the form of institutional services. After Independence social work has assumed new dimensions in Pakistan. The sources of welfare activities are inherent in the Constitution. It is on the basis of the national Constitution that the Government has adopted a social welfare programme. These activities have sought to serve the development and rehabilitation needs of the weaker sections of society especially the physically and socially handicapped, women and children, and the vulnerable sections of the community in rural and urban areas.

1. Assistance of UN Advisers in 1951

In 1951, the Government of Pakistan sought the assistance of the United Nations with a view to formulating a social welfare programme befitting a free country. A year later the first batch of the U.N. Social Welfare Consultants arrived in Karachi and this marked the beginning of a new orientation in the field of social welfare. In the absence of trained social workers, they advised the Government to give priority to social work training as without qualified workers, social welfare projects and programmes cannot be properly implemented. On the recommendation of the U.N. Advisers, the Government of Pakistan (Health Division) drew up a plan for initiating organized social welfare programme in the country in 1953. In the initial stage the Government's responsibilities were confined to imparting social work training, encouraging voluntary agencies and sponsoring of urban and rural community development projects.

2. Establishment of Planning Board in 1953

The Government of Pakistan set up a Planning Board in 1953 to prepare a plan of economic development for the country. A social welfare section was created in the Planning Board, later named as the National Planning Commission. The social welfare section was entrusted with the following responsibilities:

- Investigation of social problems and social needs arising out of social change and economic development in the country.
- Review of the social policies and legislation in the various fields of social welfare.
- Preparation of social welfare programmes for Five-Year Plans.

Scanned with CamScanner

3. Creation of National Council of Social Welfare in 1956

The National Council of Social Welfare was created in 1956 to stimulate the welfare activities of the voluntary organizations by providing financial assistance and consultative services. Following are the main objectives of the National Council of Social Welfare:

- Promoting, sponsoring or conducting surveys of the needs and requirements of social welfare organizations in the country.
- Providing stimulation and rendering financial aid to deserving organizations or institutions.
- Evaluation of programmes and projects in social welfare agencies.
- Promoting, sponsoring and conducting training/orientation courses in social welfare; and
- Assisting the Government in formulation of the social policy and legislation in the field of social welfare.

In short, financial and professional assistance to voluntary agencies is one of the major functions of the National Council of Social Welfare.

4. Formation of Provincial Social Welfare Councils

Provincial councils were formed in the provinces with the object of helping the voluntary welfare agencies both in expansion and coordination. They provide financial assistance to voluntary organizations operating at provincial level so that they are able to discharge their functions more efficiently. At present there are four Provincial Social Welfare Councils - one in each of the four provinces of Pakistan.

In addition to the disbursement of grants-in-aid, the provincial councils also undertake research studies in the field of voluntary social welfare. The provincial council is composed of both official and non-official members representing government departments, social work departments of the universities, prominent social workers and co-opted members.

5. Abolishment of Central Directorate of Social Welfare in 1962

The Central Directorate of Social Welfare was abolished in 1962 as a result of decentralization of certain subjects under the new Constitution.

6. Creation of Directorate-General of Social Welfare

In September, 1964 the Directorate-General of Social Welfare was created in the Government of the then West Pakistan. The development schemes relating to medical social work, school for the deaf, dumb and the blind and the Remand Home were transferred from the provincial Directorate of Social Welfare to the departments of Health, Education and Home respectively. Thus, the main responsibilities of the provincial Directorate of Social Welfare remained confined to community development programme and registration of voluntary agencies in the then West Pakistan.

Under Voluntary Social Welfare Agencies (Registration and Control) Ordinance of 1961, every existing voluntary social welfare agency, has to be registered and a new agency can be established only after the certificate of registration has been granted by the Registration Authority. The implementation of the Ordinance is the legal obligation of the Provincial Directorate of Social Welfare which is also the Registration Authority.

Scanned with CamScanner

7. PROVINCIAL DIRECTORATES OF SOCIAL WELFARE

After the dismemberment of One Unit in West Pakistan in July, 1970 the former provinces of Sindh, Punjab, N.W.F.P. and Baluchistan were revived. As a result the West Pakistan Directorate-General of Social Welfare and the West Pakistan Council of Social Welfare were bifurcated into four parts - one Directorate and one Council were established in each province as such. In other words, two organizations have principally been set up by the provincial governments to look after social welfare programmes in their respective provinces.

8. FUNCTIONS OF PROVINCIAL DIRECTORATES OF SOCIAL WELFARE

The Provincial Directorate of Social Welfare has been assigned the following functions:

- To establish and supervise community development projects (both urban and rural), medical social work and school social work units.
- To set up Socio-Economic Centres, Day-Care Centres and Model Orphanages etc.
- Registration, supervision, counselling and guidance to the voluntary social welfare agencies.
- To undertake research and evaluation studies in the field of social services.
- To recommend and draft social legislation.
- Coordination of all programmes of social welfare in the province.

9. DIRECTORATE OF SOCIAL WELFARE, GOVERNMENT OF SINDH

The Provincial Directorate of Social Welfare is an attached department of the Zakat and Social Welfare Ministry of the Government of Sindh. The Directorate is headed by a Director and is assisted by Deputy Directors, Assistant Directors, Field Officers and Social Welfare Officers etc. in discharging its responsibilities.

The province of Sindh has been divided administratively into 23 districts. As a corollary, district offices have been set up at district levels, namely, Karachi, Hyderabad, Sukkur and Larkana etc. headed by D.O.s having Town/Taluqa Officers under them. At District and Town/Taluqa levels, social welfare committees composed of officials and prominent social workers have been formed which are required to perform the following functions:

- To implement policies and decisions of the Sindh Social Welfare Council.
- To advice the Provincial Directorate of Social Welfare on matters relating to social welfare.
- To undertake special services in the field of social welfare according to the needs of the area.
- To coordinate functions regarding disaster relief during emergencies such as floods, rains and war etc.
- To organize functions, melas, conferences and seminars etc. on social problems from tune to time.

Scanned with CamScanner

10. Women's Committees

Keeping in view the special problems faced by women in the country, separate women's welfare committees have been formed in each district and Town/Taluqa under the chairpersonship of a prominent social worker of the area to work exclusively for promotion of the women's welfare programmes such as industrial homes, M.C.H. Centres and child welfare services etc. The Female Social Welfare Officers of the Taluqa/Town act as Secretaries of the Women's Committees.

11. Institutional Services Provided by the Social Welfare Directorate

Besides organizing community development programmes, school social work and medical social work projects, the Directorate of Social Welfare, Government of Sindh, is also running a few institutions in order to meet the varied welfare needs of the people of Sindh. A brief introduction of these institutions is given in the following pages:

12. Social Welfare Training Institute

This institute was formerly known as Child Welfare and In-service Training Institute. It was established in 1972 at Karachi by the Directorate of Social Welfare to provide training facilities to persons working in public and voluntary social welfare agencies. This is the only institute in Sindh which is providing in-service training to professional social workers. The institute also organizes workshops, seminars and conferences so that social workers may exchange their views about problems faced by the social work profession in Pakistan and may also be able to give suggestions for the promotion of social work knowledge and techniques. It has hostel facilities for those trainees who come from outside Karachi. The staff consists of a principal, instructors, a librarian and other office staff.

13. Home for Destitute and under Privileged Women (Dar-ul-Aman)

It was established at Karachi in 1961 by the Provincial Government in order to give protection to unprotected women and young children. The 'Home' is known as ***Darul Aman*** for it serves as a rehabilitation centre for those women who are deprived of the protection of their families owing to marital discords, maladjustment, death or desertion of earning members. Such women are kept in the 'Home,' trained and ultimately rehabilitated in society.

The 'Home' helps destitute and under-privileged women by arranging reconciliation with families, marriage or employment. During their stay at ***Darul Aman*** they are trained in simple cottage industries and prepared to support themselves. Children upto the age of seven years accompanied by mothers are allowed to stay in the 'Home'. The Superintendent is the incharge of the 'Home' and is assisted by one social welfare officer, a handicraft instructor and a matron.

14. Socio-economic Centre for Women

This centre for women was established by the Sindh Government at Korangi (Karachi) in 1961 with the object to improving socio-economic conditions of the low-income families by helping them to supplement their family income. This is primarily a vocational training centre wherein poor women are trained in trades such as dress making, cigar making, fancy embroidery

Scanned with CamScanner

and in other cottage industries which would enable them to either get employment in local industries or to become self-employed. The Centre secures work orders from larger industries which are distributed among trainees. Goods are also manufactured and sold in the market at competitive rates. This Centre is working under the supervision of trained staff and is headed by one Superintendent.

15. Day Care Centre

Keeping in view the problems faced by working mothers in a city like Karachi where a large number of women have been forced to work outside their homes, a Day-Care Centre has been established at Korangi, Karachi with the following objectives:

- To protect children of working mothers from anti-social influences while they are away from their homes.
- To provide better education and care to their children.
- To encourage more women to undertake employment outside their homes.

Children from three months of age to six years are admitted in the centre where they are looked after properly by the staff and are provided milk, meals and games. The children of above three years are admitted in Montessori school, which has been established as a part of the day-care programme. The Day-Care Centre is well furnished and is open from 7:00 a.m. to 7:00 p.m.

In a big city like Karachi establishment of only one Day-Care Centre cannot cater the needs of all working mothers and as such more day-care centres should be established by the government and those industrialists employing large number of women in important industrial areas.

16. Model Orphanage

The Directorate of Social Welfare in collaboration with a voluntary social welfare agency, namely, ***Kashan-e-Atafal-o-Naunehal*** is also running a model orphanage in Karachi. The aim of model orphanage is to provide the orphans with healthy environment, home-like conditions, education and training which eliminate psycho-social maladjustment and help them to grow into self-respecting and self-supporting citizens.

The Directorate has provided technical staff and financial assistance whereas the agency is responsible for providing accommodation, food and other facilities to the children of the orphanage. At present 60 girls have been provided accommodation in this institution, which is located in a spacious modern building on Stadium Road, Karachi.

The institution is working under the supervision and control of a committee composed of prominent social workers who make policies and determine administrative standard and management. Its day to day affairs are managed by the officers and staff posted at the institution by the Directorate of Social Welfare to give them technical assistance.

17. Rehabilitation Centre for the Physically Handicapped

The Provincial Directorate of Social Welfare has established a Rehabilitation Centre in Karachi with a view to providing vocational training and other rehabilitation services to the disabled persons of Sindh. This centre is housed in a spacious building previously occupied by the Adult Blind Centre near Karachi Zoological Garden. Besides conducting Braille courses and

Scanned with CamScanner

vocational training classes, it provides free boarding and lodging to about fifty inmates coming from outside Karachi. They include blind persons, deaf-dumb and the crippled. It has an attached workshop wherein some of these handicapped persons are given training in mechanical engineering including welding. The other trades in which the inmates are being trained are tailoring, carpentry, mat making, chair-canning, electrical wiring and radio-T.V. technology. The centre is well equipped and has qualified staff.

18. Women Welfare Centres in Sindh

The Directorate of Social Welfare with the financial assistance of the Women Division, Government of Pakistan, has established 15 women centres in Karachi Division, 24 women centres in Hyderabad Division and 20 women centres hi Sukkur Division. These centres are located mostly in rural areas. Trades imparted in these centres are sewing, cutting, needle craft, and embroidery work. Lectures on adult education, health, nutrition and social education are also arranged.

19. Re-organization of Directorate of Social Welfare, Govt. of Sindh

Community Development Department (Social Welfare) functions in the district under District Nazim and Executive District Officer (E.D.O.) in coordination with Provincial Directorate. Social Welfare Officers attached to the district have been assigned various duties to perform which are the following:

- Keep a watch on implementation of various schemes undertaken by the department.
- Assess and improve the performance of various departments, institutions and projects of social welfare in the district and to chalk out then- plans.
- Assist and guide the deputy district officers of Social Welfare Department working under him.
- Extend cooperation to government departments in meeting public: exigencies like abnormal rains, flood & war like situation.
- To extend help and guidance to N.G.O.s of the district in improving their performance and raising their standard.
- To help organizations desirous of registration with Social Welfare Department and to register them.
- To prepare the feasibility report of organizations seeking grants in aid from Sindh Social Welfare Council and National Council of Social Welfare.
- To implement programmes under the direction of Federal and Provincial Governments.
- To establish District, Town, Taluqa and Tehsil Social Welfare Committees and District Management Committees in order to improve the social welfare activities and create new ones with the help of local administration.

Citizens community board: Under Local Government Ordinance, Citizens Community Board was established and with this started the process of transfer of power at grass root level that helped public participation in social welfare activities.

Local needs of the area can effectively be tackled through these boards on priority basis. For persons sympathetic to community welfare and the philanthropists interested in social welfare work the Citizens Community Board can be an important media for their activities.

20. Provincial Commission for Child Welfare and Development, Government of Sindh

Background: The Convention on the Rights of the Child (CRC) was adopted through a unanimous decision of UN General Assembly on November 20, 1989. The main theme of CRC focuses attention on survival, security and development of children. Pakistan is among the initial few nations to sign CRC and thus committing itself for effective implementation and realizing the objective of CRC. The CRC provisions read with reference to Islamic injunctions on the subject provide us a base for taking appropriate administrative and legislative measures to knit the child rights in Government policies and make it a way of life.

Introduction: The PCCWD was set-up by the Government through a Notification. As a provincial counter-part of National Commission for Child Welfare & Development it is functioning as a unit of Social Welfare Department, Sindh. The composition of PCCWD consists of representatives from public and private sectors. The Commission is working in collaboration with Government Departments, UNICEF and the NGOs. In Sindh, the CRC execution responsibility lies with Social Welfare Department and PCCWD.

Objectives: To prepare a policy on child welfare in Sindh within the framework of National Policy on the subject.

To translate into action the provisions of CRC, promote and protect the Child Rights especially concerning their nutrition, health, education, recreation, protection and juvenile justice.

- To implement the policy on child welfare and development in Sindh.
- To suggest amendments in existing laws on children so as to bring them in harmony with CRC.
- To oversee all types of child abuse and suggest remedial measures.

Activities: Working with Government Departments and NGOs in promoting child welfare activities and establishing liaison among them for effective functioning.

Initiating and assisting action oriented specific programmes towards the implementation of CRC.

Evaluation of existing services for child welfare and development with a view to strengthening and streamlining these in the context of priorities

Organizing seminars, workshops and training programmes

Priorities: To strengthen the associations working for the welfare and development of children.

- To establish a research unit and a resource centre.
- To establish Shelter Homes for missing, homeless, abused and street children.

Scanned with CamScanner

21. Directorate of Social Welfare, Government of Punjab, Lahore

Like other administrative departments of Punjab Provincial Government, Social Welfare Department, Women Development and Baitul Mall were established headed by a secretary of Punjab Government. Under him functions a Social Welfare Directorate headed by a Director General.

Administrative set-up

Under Director General of Social Welfare the following officials work:

- Director (Programmes)
- Director (Administration)
- Director (Research & Development)
- Deputy Director (Public Relations and Publications)
- Deputy Director (Planning)
- Deputy Director (Industrial Homes)
- Deputy Director (Design)
- Deputy Director (NGOs)

In addition to these officers, 6 assistant directors and other subordinate staff are attached to it. While at ex-divisional level deputy directors, at district level assistant directors and at tehsil level social welfare officers are appointed.

In Punjab some 28 colleges provide social work as optional subject at B.A. level while for M.A. classes Punjab University has established a Social Work Department. Considering the vast population of country's biggest province imparting education on the subject in four universities only is quite inadequate.

Responsibilities of directorate of social welfare, Punjab

- To create consciousness of social welfare and motivate people for public service with the help of media and non-formal education.
- To provide vocational and technical guidance to registered voluntary organizations and arrange financial aid for them.
- To take necessary steps to train and rehabilitate orphans and destitute women.
- Arrange training and rehabilitation of disabled and old persons.
- Take suitable steps to eradicate social evils.
- Arrange community activities to surmount natural calamities.
- Create awareness of social problems and motivate people for welfare activities through documentaries, press conferences, discussions, seminars and symposiums.

Non-government organizations (NGOs) in Punjab

According to 1961 Ordinance, non-government organizations (NGOs) means "the organizations established by the public for the welfare of the people run by public funds, donations and government grants"

In Punjab the following types of NGOs are functioning:

- Philanthropists' organizations helping the poor and helpless people.
- Community development councils running locally through "self help" under the professional and technical guidance of Social Welfare Department of the Government.
- Other welfare organizations include such institutions which work for the disabled persons, orphans, widows, old and infirm, beggars, youths and women exclusively.
- Besides these organizations, there are professional groups and trade organizations which look after the health, education, mentally and physically handicapped.
- The department of Social Welfare keeps watch over these NGOs and guides them where necessary.

In Punjab some important voluntary welfare organizations include Anjuman Himayat Islam, Lahore; Fountain House, Lahore; Institute for rehabilitation of disabled persons, Ferozepur Rd. Lahore; Fatmid Foundation, Lahore; Punjab T.B. Association; Al-Shifa Eye Hospital, Rawalpindi; Sir Sayed Academy, Rawalpindi; Okara Welfare Trust; Women Welfare Society, Sabiri Colony, Okara etc. There are many more organizations spread throughout the province.

In Punjab total registered NGOs are around 4661.

22. Major Programmes of the Directorate-General

In the following pages, important programmes of the Directorate-General of Social Welfare, Government of the Punjab are briefly discussed:

i. Community development programme

This programme is being implemented at District, Tehsil, sub-Tehsil and selected Thana levels and comprises 133 units serving around 1.70 million beneficiaries. It aims at:

- Promoting better living in a community.
- Tapping local resources in the form of CBOs and NGOs.
- Developing cooperative and collaborative attitude.
- Promoting self-reliance and encouraging local leadership.

ii. Medical social services projects

These projects have been established at all major district and tehsil hospitals in 34 districts of Punjab. These medical social services are providing help to poor, needy and destitute patients and also addressing their socio-economic and psychological problems. The social workers arrange medicines, financial assistance and undertake follow-up services for them.

iii. Shelter homes (Dar-ul-Aman)

The Directorate has established eight shelter homes in the province where 1922 women have taken shelter. These shelter homes are providing protection, institutional care and vocational training to destitute women who are deprived of family support for various reasons. These destitute women are being rehabilitated either by arranging reconciliation, marriage or employment through vocational training in the institution.

iv. Hostels for working women

The Directorate has established 10 hostels in the province of Punjab -one at all ex-divisional Head quarters and two each at Lahore and Rawalpindi. In these hostels about 1200

Scanned with CamScanner

working women have been provided accommodation. In the present circumstances, many women for their monetary or other constraints are obliged to seek employment outside their home town.

v. Social services centres for lost and kidnapped children (*Nigehban*)

Eight social services centres for lost and kidnapped children have been established in major cities of Punjab where around 2812 kidnapped or lost children have been given shelter. The main function of social workers is to find out parents or other relatives of such children and thus help in the reunion of lost children with their families.

vi. Homes for old and infirm persons (AAFIAT)

Three Homes for old and infirm persons are working in the province of Punjab (at Lahore, Multan and Rawalpindi) where around 134 such persons have been provided accommodation. In these centres only those senior citizens are provided shelter who have nobody to look after them. The inmates are provided accommodation, food, training, treatment and rehabilitative services free of cost.

vii. Home for the disabled persons (Nasheman)

The institution has been established at Lahore and it is providing institutional care, medical and rehabilitative services to 75 inmates.

viii. Half-way home (Dar ul Sakoon)

This institution has been established at Lahore for providing an enabling and conducive convalescence to mentally sick patients. At present, 85 mentally sick patients have been provided shelter. They are provided supportive and rehabilitative services with the objective of mainstreaming them with their families.

ix. Social welfare training institute, Lahore

Social Welfare Training Institute (SWTI) has been established at Lahore by the Directorate-General of Social Welfare to cater to the training needs of the functionaries of the department and of NGOs. The syllabus of the institute consists of 35 courses. During 2005-06, about 1215 persons were given training in the techniques and methods of social work.

23. The Provincial Council for the Rehabilitation of the Disabled Persons

The Council was constituted under the provisions of the Disabled Persons (employment and rehabilitation) Ordinance, 1981. The Council is responsible to overseeing the welfare and rehabilitation programmes for the disabled in the province of Punjab including employment of the disabled persons under 2% quota in all public and private establishments having 50 or more employees. The District Assessment Boards and District Training and Rehabilitation Centre for the Disabled Persons are providing social services to the disabled.

24. Punjab Welfare Trust for the Disabled

The Punjab Welfare Trust for the Disabled is also providing financial assistance to NGOs dealing with the disabled. During 2004-05, Trust provided financial assistance of Rs. 1, 91, 76,000 to 52 NGOs of Punjab.

25. Functions of Punjab Social Services Board

The main functions of PSSB are:

- To formulate polices with regard to the objective of the Board.
- Plan, coordinate, integrate, evaluate and intensify social welfare programmes in the province.
- To disburse grant-in-aid including National and Provincial Grants every year to NGOs after proper scrutiny.
- To improve the working of voluntary social welfare agencies by giving them professional and technical assistance and grants-in-aid and to perform such other functions in respect of these agencies as may be entrusted to the Board by or under any law.
- To control the raising and utilization of funds by voluntary Social Welfare Agencies for their audit.
- To inculcate in the citizens of the province, particularly in the students and youths, the spirit of serving the cause of social welfare with dedication.

26. Projects of PSSB

The major projects of PSSB are given below:

- Grants-in-aid to NGOs.
- Publication of quarterly magazine of PSSB - "Hayyah Allal Falah."
- Industrial centre and cooking classes in PSSB Waqf Building at 12, Rustam Park, Lahore.
- Micro-credit facility to NGOs out of dissertation funds of the vice-president of P SB.
- Training and Research.

27. Federal Ministry of Special Education and Social Welfare

The Federal Government comes into the picture in respect of certain national programmes or activities concerning which they either act directly or indirectly through assistance to the Provincial Governments. In respect of both health and social welfare the efforts of the Provincial Governments are supplemented to a considerable extent by the Federal Government. Besides reviewing of the social welfare policies and social legislation, the Federal Ministry of Special Education and Social Welfare is also responsible for planning and coordination of Government Departments and related organizations concerned with social welfare.

28. Establishment of Directorate-General of Special Education in 1985

The establishment in 1985 of a separate Directorate-General of Special Education within the Ministry of Special Education and Social Welfare was a significant event in the field of special education in Pakistan. The need for such a body was badly felt in order to plan and develop services for the disabled with greater coherence and urgency than had been previously possible. The main function of this Directorate is to develop facilities and services for the disabled in the country. It is hoped that with a strengthened structure and a sound national social policy, die organization and management of the emerging social services will be effective and will pave the way for rapid progress in the field of special education.

Scanned with CamScanner

Rehabilitation & special education centres

The Directorate-General of Special Education has so far established more than forty rehabilitation centres in provincial and district-headquarters. In addition to these, six national special education centres have been set up in the Federal Capital which are as follows:

- **Helen Keller Centre for Hearing Impaired Children:** It is a model special education institution for children with hearing impairment established by the Government of Pakistan at Islamabad in 1987. The medium of instruction is Urdu.
- **Ibn-e-Sina Centre for Mentally Retarded Children:** Established in 1987, this centre caters for the special education and rehabilitation of mentally retarded children aged between 3 to 12 years.
- **Al-Farabi Centre for Physically Handicapped Children:** This centre was established in 1982. It caters for the children between the ages of 2 to 12 years who have physical and sensory handicaps. It aims for each individual to achieve the maximum degree of independence and efficiency of functioning as a happy and participating member of a challenging and changing society.
- **Al-Maktoora Centre for Visually Handicapped Children:** It is a model centre established by the Federal Government for the children with visual handicap which is intended to be a centre of excellence. Besides formal education through the medium of Braille and special optical aids etc., it provides training to students in daily living skills and mobility.
- **National Institute for the Handicapped:** The institute has been recently established to coordinate health related services for disabled persons on a national scale. It will provide treatment to the disabled in various disabilities. The centre will employ specialists in various fields of disabilities and highly trained para-medical staff for treatment and care of the disabled as out-patients and in-door patients. The institute has been designed for delivery of services to the entire country.
- **National Training Centre for Disabled Persons:** Top priority has been accorded to the training needs of professionals working in the field of special education and rehabilitation. For this purpose the Director-General of Special Education started in 1986 a National Training Centre for the Disabled Persons at Islamabad. It has been set up to impart technical and vocational education to disabled persons. During the first two years of its operation it has provided short course training opportunities to over one thousand teachers and other personnel. This centre is currently providing training in six trades to almost 200 young people who are disabled. As it moves into the next phase of its development the institute will play a crucial role in coordinating the work of Pakistani experts and those provided by overseas agencies.

29. The National Council for the Rehabilitation of the Disabled, Islamabad

This council provides policy guidance and support to the Special Education and Social Welfare Division of the Federal Government. It draws its membership from government officials and NGOs. The council has proved very helpful in getting cooperation of various agencies working in the field of rehabilitation of the disabled. The involvement of disabled persons themselves in this process of consultation has been enhanced by the establishment of the National Society for the Deaf.

30. National Trust for the Disabled

The creation of this Trust must be taken as an important landmark in the development of social services for the disabled in Pakistan. This autonomous body has been charged with the responsibility of formulating policy and of its implementation in all matters relating to special education and rehabilitation of disabled persons. It has been given the power to raise funds and to negotiate with national and international aid-providing agencies. The affairs of the National Trust are guided and controlled by a Governing Body consisting of government officials and representatives of the NGOs. The initial financial allocation to the Trust was Rs. 400 million which exceeds the total allocations made to special education and rehabilitation in previous budgets. Its creation and the generous initial allocation of funds it has received will ensure that the momentum of development in the field of rehabilitation for the disabled will be sustained in future.

31. National Social Welfare Policy

From the above survey it has transpired that significant achievements have been recorded over the past several years in the field of social welfare. Nevertheless, some serious problems still remain to be tackled. As such there is an urgent need to devise a realistic national social welfare policy so that the onslaught of present social problems and challenges of future can be effectively met. It cannot be denied that to achieve the aims and objectives of an Islamic welfare state a comprehensive national social welfare policy is a *sine qua non* which may ensure for each citizen economic independence, social justice, equality of opportunity and highest possible degree of self-respect, and above all to enable every citizen to participate and contribute according to his ability in the socio-economic development of the country.

32. Establishment of High Level Committee

The Government of Pakistan in 1988 had appointed a high level committee consisting of senior government officials and experts in the field of social welfare, for the purpose of formulating a national social welfare policy. Earlier a National Conference of Social Welfare held in July, 1988 had deliberated on the subject of social policy.

33. Recommendations of the Drafting Committee

The recommendations of the drafting committee which emanate from the deliberations in the National Conference are given below:

- **Development of facilities & services:** To develop facilities and services for children, youths, women, senior citizens, disabled persons, the communities of low income groups in slum areas, rural areas, tribal areas and backward areas;
- **Strengthening of existing development projects:** To strengthen the programmes of existing community development projects, social welfare centres and institutions and to expand them to all areas in the country;
- **Development of financial resources:** To develop and mobilize financial resources for social welfare through Zakat and Ushr and other resources available at community, national and international levels;
- **Monitoring and supervision of programmes:** To evaluate, monitor and supervise the social welfare programmes in government and non-government/voluntary sectors;

Scanned with CamScanner

- **Functional & technical assistance:** To promote non-government/voluntary effort through financial and technical assistance and to take appropriate measures to ensure active involvement of social welfare agencies for sharing and supplementing government effort for welfare of all categories of people and special groups;
- **Expansion of education & training facilities:** To strengthen and expand the existing education and training facilities in social work so as to ensure availability of manpower required for planning and implementing programmes of government and non-government voluntary agencies;
- **Promotion of research studies:** To promote research studies on all aspects of social welfare in collaboration with the University Departments of Social Work, social welfare institutions and other relevant agencies;
- **Standardize services:** To standardize social welfare services;
- **Provision of suitable career structure:** To make the social welfare programmes more effective and result oriented by providing an appropriate career structure for professional social workers and to safeguard their interest of service;
- **Review of existing legislature:** To review existing legislation concerning social welfare in order to meet the present and emerging requirements; and
- **Enhancement of organizational and administrative structures:** To evolve suitable organizational and administrative structures at federal, provincial and local levels for policy making, planning and implementation as well as coordination in the field of social welfare.

34. Formulation of 7th Five-Year Plan

In the opinion of the drafting committee, "in drafting this document effort has been made to be realistic and a major part of this policy could be implemented through a redeployment of the existing resources." It is further claimed that "this policy has been formulated keeping in view the contents of 7th Five-Year Plan."

35. Social Welfare Department Punjab

After the dismemberment of one unit in West Pakistan in July, 1970 the former provinces of Sindh, Punjab, NWFP and Balochistan were revived. As result the West Pakistan Directorate General of Social Welfare and the West Pakistan Council of Social Welfare were bifurcated into four parts. One Directorate and one Council were established in each province as such. In other words, two organizations have principally been set up by the provincial governments to look after social welfare programs in their respective provinces. In 1979 a separate department of Social Welfare was established. Afterwards in 1996, the segment of Women Development and in 1998 the segment of Bait-ul-Maal was also attached with Social Welfare Department. Later on in 2012, a separate department of Women Development was established and the segment of women development was separated from Social Welfare and Bait-ul-Maal Department.

36. Shaheed Benazir Bhutto Human Rights Centers for Women (Crisis Centers)

Shaheed Benazir Bhutto Human Rights Centers for Women were working under Federal Government but after 18th amendment these centers have been adopted by Punjab Government,

Social Welfare Department in 2014. There are a total 12 centers working in Bahawalpur, Dera Ghazi Khan, Faisalabad, Muzaffargarh, Khushab, Lahore, Multan, Rawalpindi, Sahiwal, Mianwali, Sialkot and Vehari. The centers are established with the objective to protect women against all forms of violence and to eliminate every type of discrimination against women.

Crisis Centres provide:

- Temporary shelter to victims of violence in emergencies
- Medical/ first aid to women in distress
- Free legal assistance/ aid to women in distress
- Free social, psychological and legal counselling to the women
- Liaison with agencies competent to redress grievances of women at individual and collective levels, especially those concerned with combating violence against women

37. Conclusion

In a developing country like Pakistan, there is an urgent need for reconsideration and reformulation of social policy if sustained economic growth is to be achieved. Social policy provides a guide line to socio-economic action and indicates the extent of social consciousness and nature of social efforts for eradication and prevention of social problems. "Risks of failure of an inadequately thought out, though well intentional programme, in social field may result not only in wastage of resources alone, it may shatter the people's faith and confidence in social service." This means that we should have a carefully prepared priority-list with respect to our needs and resources. Every programme should be consistent with the needs and resources of the country. We have limitless socio-economic problems, but we have only limited resources to deal with these problems. Therefore, evaluation of social welfare programmes should be conducted on the basis of cost and benefits. Redefinition of social welfare in the context of our social needs is urgently called for.

CHAPTER 3

PAKISTANI SOCIETY

1. DEFINITION

The term society is very loosely defined in Sociology. Almost, all the disciplines of social sciences use this term, but its standardized and precise definition is still lacking. Sociologists do not agree on exactly what constitutes "society" and what is or is not functional for it. We are not still sure as to what are the exact attributes of "society". There are scores of definitions of "society", but hardly a few of them have all the characteristics of a good definition. However, some of the definitions are given as under:

- It is the largest group in which individuals have relationships.
- A society refers to a larger grouping of people who share a common set of habits, ideas, attitudes and consider themselves a social unit.
- It is "a system of usages and procedure of authority and mutual aid of many groupings and divisions of controls of human behaviour.
- It is a group of people associated together for some common interests or purposes.
- It is the sum total of human relationships.
- Society is a relatively large group that will continue to exist satisfying the basic needs of the members, such satisfaction implies a time span of at least two generations.

"A society is a type of social system, in any universe of social systems which attains the highest level of self-sufficiency as a system in relation to its environment."

The last definition refers to an abstract system in which human actions are given primary considerations through which the highest level of self-sufficiency is attained in a society within a given environment. This view is in contrast to a common sense notion of society, i.e., comprising concrete individuals. Parsons believes that the organisms and the personalities of the memoires of the society would be the external to the society, not as part of its environment.

According to Parsons, the criterion of self-sufficiency of society can be divided in to five sub-criteria, each relating to one of the environments of social system, i.e., ultimate reality, cultural systems, personality systems, behavioural organism and the physical-organic environment. The self-sufficiency of a society is a function of the balanced combination of its controls over its relations with these five environments and of its own state of internal integration.

Society is a group of people with a common, at least somewhat distinct culture who occupy a particular territorial area, have a feeling of unity and regard themselves as a distinguishable entity.

In the above definition society has been conceived as a special type of group with a comprehensive social system. It includes all basic social institutions required to meet basic human needs. It is independent in the sense that it includes all of the organizational forms essential for its survival. Furthermore, society has the means to survive for a long period of time. It recruits its members by biological reproduction within its members.

Robert E. Park, the human ecologist defines society as a level of human organization based on communication and culture and regarded as superimposed and distinguished from a power, sub-social level of organization that was referred to as community or biotic community.

2. CHARACTERISTICS OF SOCIETY

From the above definitions one can realize that there are some important points which are common and should be considered as the important features of society. Such characteristics are enumerated as under:

- It is a large human group.
- It satisfies the needs of its members.
- There are common interests or purposes among its members.
- There is a "consciousness of kind" among the members of society.
- It is always changing.
- It is not subordinate to individuals but these characteristics are interdependent on each other.
- There are established roles and statuses for its members.
- It is larger than community.
- It has its own culture.
- It has its own means to survive.
- It is a self-sufficient social system.
- It lasts for a longer period of time than groups or communities.

The concept of society is used in both narrow and broad senses. Sociologists generally do not use this term in the latter sense, which refers to every kind of social relationship. There are no geographical limitations for the people belonging to a society. In a narrow sense society may be regarded as the people, who live within a given geographical area, have a common history and some permanence in their relationships. Society deals with specific, definite and direct type of relationships of the people. A college Sociological Society or a Historical Society can be quoted as the examples of society in a narrow sense whereas, Pakistani Society, Russian or American Society can be the examples of the societies in the broader sense.

3. DIFFERENCE BETWEEN RURAL AND URBAN COMMUNITIES

The rural and urban Communities are much different from each other on the following grounds

- **Division of labour:** In a rural community the dominant profession is agriculture. The number of professions is limited in this community due to similarity in social conditions.

  The urban community has a large number of professional activities due to diverse social conditions.

Scanned with CamScanner

- **Density of population:** The population in rural areas is sparse. The people live in their own farms called 'Farmstead Settlement". Even the villages and hamlets (basti or chak) have small population.

  The urban areas are thickly populated. In a city of a few square miles millions of people live. The houses are joined together.
- **Nature of relations:** The relations in-rural areas are informal and based on sincerity and mutual help. In urban areas the relations are formal and reciprocal.
- **Environment:** In rural areas the environment is almost natural. The people live in nature, work in nature and die in nature. The animals, trees, plants, crops, water channels, sunrise, sunset, moonlit night, starry night, clouds and rain are the companions of their life.

  In urban areas the social life is based on industrial relations. The needs are satisfied by the production of industrial goods. Even the social relations have industrial means of communication.
- **Social mobility:** Among the rural people the social changes are seldom found. Mostly the people are satisfied with their social conditions. Very rarely they change their place of residence and profession. The change in their classes occurs infrequently due to little changes in income. It means the rate of social mobility is insignificant among them.

  The urban life is ever-changing due to expansion or education, technology and industry. The people change their professions, residences and classes for adjustment with the new social conditions. This type of adjustment in society is celled social mobility. The rate of this mobility is higher in this area.
- **Social stratification:** In rural areas the significant elements of social stratification are caste, profession, and the economic resources. While in urban areas the economic resources and education standard are its important elements
- **Size of population:** The rural population lives in smaller groups separately and in villages. The population in urban areas is clustered in millions. It means the size of population is larger in cities than in villages
- **Social differentiation:** The social life in rural areas is simple and based on similar social conditions. In urban areas the people of diverse nature live together. The people of different races, sects, castes, professions, classes and political parties live together.
- **Social interaction:** In rural areas the social interaction is informal, slow and under necessary conditions. In urban life it is formal, reciprocal and fast.
- **Solidarity:** On the basis of similarity in social life solidarity exists in rural areas. People live an organised social life. In urban areas due to different social conditions the life is seldom organised due to which loose social solidarity is found. Seldom are the people satisfied with their present conditions. They make changes rapidly by which the bonds of old systems break and solidarity weakens in urban communities.

CHAPTER 4

CULTURE

1. DEFINITION

Sir Edward Taylor: "*Culture is the complex whole which includes knowledge, belief, art, morals , laws, customs and other capabilities and habits acquired by man as member of society*" Pakistan, china and USA have different cultures.

Horton and Hunt: "*Culture is everything which is socially learned and shared by members of society.*" It is a social heritage. 'Culture is manmade environment.'

2. DIFFERENT VIEWS ABOUT CULTURE/CHARACTERISTICS OF CULTURE

- **Culture is actually shared:** All the traits, attitudes, ideas, knowledge and material objects like radio, television, automobile etc. are actually shared by members of society.
- **Culture is transmitted:** All the cultural traits and objects are transmitted among the members of society continually. Most of the cultural traits and material objects are transmitted to the members of society from their forefathers. Transmissions can be both from contemporaries as well as from older generations. From our contemporaries, for instance, we learn new fashions, political views, how to move in society and how to behave in a particular social situation.
- **Cultural is ever changing:** Change in culture is inevitable. For example, man has landed on the moon form stone age. This has become possible only due to continuous change both in material and non-material culture.
- **Culture is accumulative:** Culture is not a matter of month or a year. It is transmitted from one generation to the next. The new cultural elements are added up as the needs arise. Discoveries and inventions bring new cultural traits. Many cultural traits are borrowed from outside cultures.
- **Culture is pervasive:** Culture creates a world taken for granted; it forms the unconscious premises of thought and action. Culture tends to be pervasive, touching every aspect of life. Culture dominates social activates and social institutions.

3. KINDS OF CULTURE

The man made environment can be classified into two main categories in order to analyze the culture.

- **Material culture:** Material culture includes all the things that are having physical form. For instance, pen, table, radio set, book, automobile etc. (Tools, furniture, buildings etc.) are some of the examples of material culture.

Scanned with CamScanner

Generally, the agrarian and the industrial societies are rich in respect of material culture due to greater use of science and technology in all walks of life as compared to the primitive societies. It is considered that material culture is close to civilization.

- **Non-material culture:** It consists of ideas, customs, beliefs, traditions, value system, knowledge, philosophy etc. It does not have physical shape. These are very important in determining the human behaviour and have a strong hold on the individual. The non-material part of culture is responsible for enriching the material part. Both parts are interrelated with each other.

4. Elements of Culture

There are various elements of culture. Generally, it is classified into the following six parts though there is no set rule to divide it into water tight compartments.

- **Trait:** It is the smallest unit of culture and we cannot think to sub divide it. It is not easy to count the exact number of cultural traits in a given society.

  Characteristics of trait: It has four characteristics:

  - **Form:** The smallest part of culture has some physical or nonphysical form which can be seen or perceived by the people.
  - **Use:** Such a trait is useful for the individuals who are the participants of culture. They get some satisfaction from its use which may be physical or emotional irrespective of value Judgment.
  - **Function:** It contributes to the integration of cultural whole.
  - **Meaning:** It has a special meaning for the individuals of a particular culture. For example, people of Pakistan use "Huqa" for smoking purposes but Americans who visit our country may take 'Huqa' to America with them on their return and use it for decorative purposes

- **Complex:** When two or more cultural traits are combined it can be called a complex
- **Pattern:** When two or more complexes are combined, they form a pattern. There is uniformity in the human behaviour due to the cultural patterns.
- **Theme:** The combination of two or more cultural patterns results in a theme. Themes do not come into existence unconsciously or just by chance but these are the result of organized and deliberate efforts of the individuals. The postulate like "All human beings are equal" can be an example of theme in our culture.
- **Configuration:** When two or more cultural themes are integrated, the product is called cultural configuration. e.g. caste, marriage system etc. It is not essential that a social institution may wholly and solely share a single configuration. For example, caste system prevailing in Indo Pakistan sub-continent is the property of any particular social institution. It is shared by religious, economic, family and marriage institutions.
- **Ethos:** Cultural ethos is the flavour or central point of a culture. It is the philosophy or ideology of entire culture, around which (ethos) the entire society rests. The behaviour of individual in the given culture is directly or indirectly affected by its ethos

For example, Pakistani culture is attributed as religious while Japan's as cooperative America's as competitive, and Russia's accommodative to describe briefly these cultures.

- **Geographical factors:** Climate and geographical factors play a pivotal role in cultural development. Early civilizations are examples in this regard.
- **Non human and social organization:** Non humans have no particular system of social life. Human only create cultures and not the animals.
- **Language and symbolic communications:** Body language is also a form of commutation.
- **Animal culture:** Animals do not have any culture only humans have culture.

5. Culture as a System of Norms

Since culture includes the ways in which things should be done, we say that culture is normative, which is another way of saying that it defines standards of conduct. For shaking hands, we extend the right hand; this is proper in our culture. For scratching our heads we may use either hand; our culture has no norm for head scratching.

The term "norm" has two possible meanings. A statistical norm is a measure of what actually exists; a cultural norm is a concept of what is expected to exist. Sometimes the statistical norm is referred to as the "real" culture and the cultural norm as the "ideal" culture. Often people do not distinguish between the two norms. A statistical norm is a measure of actual conduct with no suggestion of approval or disapproval. A cultural norm is a set of behaviour expectations, a cultural image of how people are supposed to act. A culture is an elaborate system of such norms-of standardized, expected ways of feeling and acting-which the members of a society generally acknowledge and generally follow. These norms are of several kinds and several degrees of compulsion, as seen in the following classification. Most of these concepts were developed by the early sociologist William Graham Sumner in his Folkways published in 1906.

i. Folkways

Social life everywhere is full of problems. Human beings seem to have tried every possible way of dealing with such problems. Different societies have found a wide variety of workable patterns. And so it goes for thousands of items of behaviour. Each trait is a selection from a number of possibilities, all of which are more or less workable. Through trial and error, sheer accident, or some unknown influence, a group arrives at one of these possibilities, repeats it, and accepts it as the normal way of meeting a particular need. It is passed on to succeeding generations and becomes one of the ways of the folk-hence, a folkway. Folkways are simply the customary, normal, habitual ways a group does things.

New generations absorb folkways partly by deliberate teaching but mainly by observing and taking part in life about them. Children are surrounded by folkways. Since they constantly see these ways of doing things, they come to believe these are the only real ways.

Even the most primitive society will have hundreds of folkways; modern, industrialized societies have thousands and shaking hand, eating with the right hand are a few examples of our folkways.

ii. Mores

Some folkways are more important than others. We therefore recognize two classes of folkways: (1) those which should be followed as a matter of good manners and polite behaviour

Scanned with CamScanner

and (2) those which must be followed because they are believed essential to group welfare. These ideas of right and wrong which attach to certain followers are then called mores. By mores we mean those strong ideas of right and wrong which require certain acts and forbid others.

Members of a society normally share a sublime faith that violation of their mores will bring disaster upon them. In other cultures and may have no necessary connection with group welfare. It is not necessary that the act forbidden by the mores should actually be injurious. If people believe that the act is injurious, it is condemned by the mores. Mores are beliefs in the rightness or wrongness of acts.

The irrationality of mores should not be exaggerated. Some mores are based upon a very genuine cause-and-effect relationship. For example, random killings would threaten group survival and individual peace of mind; therefore, every known society has condemned the killing of a fellow member of that society.

Mores are not deliberately invented or thought up or worked out because someone decides they would be a good idea. They emerge gradually out of the customary practices of people. Mores arise from a group belief that a particular act seems to be harmful and must be forbidden for, conversely, that a particular act is so necessary that it must be required. To question mores is indecent, and to violate them is intolerable. Every society punishes those who violate its mores.

Mores are taught to the young not as a set of practical expedients but as a set of sacred absolutes. They must be internalized. To internalize means to learn or accept something so completely that it becomes an automatic, unthinking part of our responses. When fully internalized, mores control behaviour by making it psychologically very difficult to commit the forbidden act we do not refrain.

Some people claim that mores are just group opinions and are not the same as "real" right and wrong. They argue for absolute standards of morality, claiming that the nature of the universe makes certain actions definitely wrong and others definitely right, regardless of time, place, or circumstances. This is an important ethical issue but one which usually has meaning only for philosophers and theologians. As far as the behaviour of most people is concerned, "mores" is simply another word for "real" right and wrong. For, as Sumner has observed, mores can make anything right and prevent condemnation of anything.

iii. Institutions

Some clusters of folkways and mores or more important than others; for example, those concerned with forming families and raising children are more important than those concerned with playing football. Organized clusters of folkways and mores dealing with highly important activities are embodied in the social institutions of the society. Institutions include behaviour norms, values and ideals, and systems of social relationships. For a formal definition we suggest: an institution is an organized system of social relationships which embodies certain common values and procedures and meets certain basic needs of the society. In most complex societies there are five "basic" institutions family, life, religion, government, education, and organization of economic activities. In modern societies, science is institutionalized

Institutions are among the most formal and compelling of the norms of a society. With the folkways and more surrounding an important activity become organized into a quite formal, binding system of belief and behaviour, an institution has developed. Markets, checking accounts, and collective bargaining are economic institutions which began with

simple barter thousands of years ago and passed through many stages of desert of behaviour patterns which have become highly standardized; (2) a set of supporting mores, attitudes, and values, and (3) a body of traditions, rituals and ceremonies and symbol. Social institutions will be treated in detail in later chapters but are introduced here because the concept must be used throughout out discussion.

iv. Laws

While some mores function simply as mores there is a strong tendency for them to become incorporated into the laws of associate. Many people will obey mores automatically or because they want to do the "right" thing. A few people, however, are tempted to violate mores. These people may be forced to conform by the threat of legal punishment. Thus the law serves to reinforce the mores. Those who still will not conform are punished, imprisoned, or even executed. In any complex society, law enforces the mores and also protects and peeves the social system in which there are always some who are more privileged than others.

v. Values

Mores are ideas about whether acts and right or wrong. Values are ideas about whether experiences are important or unimportant. For example, there is no moral debate about whether classical music is right or wrong. But while some people consider hearing of classical music one of life's great experiences, for others it is a crashing bore. People who highly value physical fitness will exercise regularly and watch their food and drink. Values thus guide persons' judgments and behaviour.

In each society some values are prized more highly the others. The members of a simple society generally are closely agreed upon a single set of values while complex societies develop conflicting value systems. For example, is it more important to promote maximum economic development or to protect the environment? Should people develop individuality or be responsive to group opinion? Is change better than stability? Would a return to the "simple lid" be a gain or al loss? Value disagreements are endless or complex societies, and values change from time to time. Value shifts also affect the folkways and mores.

Values are an important part of every culture. An act is considered "legitimate" - that is, morally acceptable - when it is in harmony with accepted values. When our values defined the admirable woman as dutiful, domestic, and dependent, it was "legitimate" to discourage higher education for women. But now that we increasingly adore women who are self-reliant, independent and successful, higher education for women is considered legitimate and necessary.

6. SOCIALIZATION

Definition: "The process of inducting an individual into the social world." The mechanism functioning behind socialization is social interaction. It teaches us culture of society. From this process individual acquires his human qualities, he learns language and other cultural patterns. It develops 'self', 'mind' and 'personality'. Thus socialization is society's attempt to teach us its ways of culture.

Scanned with CamScanner

i. Ways of Socialization

There are two ways to socialize individuals.

- **Cultural conditioning:** It is a process of learning by repetition or imitation. Such learning includes: learning to walk, talk, religious fundamentals, obedience to parents etc. It enables child to become the member of society.
- **Personal social learning:** When a child grows up, learning by condition slows down and learning by reason speeds up. The social interaction plays an important role in this type of learning because by interaction experiences are transmitted among the people. This type of learning occurs at stage of secondary socialization.

ii. Kinds of socialization

There are two important kinds of socialization:

- **Informal socialization:** A social learning in which an individual receives in his primary group or from those he is in direct contact with such as parents, family, play mates and also books he reads. For example, learning of beliefs, language and moral values fall in this category.
- **Formal socialization:** It includes both conscious learning of an individual which takes place in a particular direction with specific purpose and under certain rules and regulations in an organized way. For instance, child gets training at school, the training and grooming of army officers as well as civilians fall in this category.

iii. Agencies of socialization

Those institutions of society through which socialization is carried out. They are:

- **Family:** is a place where a newly born child learns the ABC of socialization. Learning of language etc. is taught through family. Prof. Abdul Hamid's study shows that in Pakistan 87% of criminals were treated harshly and indifferently by their step-parents and therefore they became criminal.
- **School:** is one of the basic forms of formal education. In schools an individual learns morality, nationalism, patriotism, ideology and adopts norms, habits and customs. The teacher is the great interpreter of the great moral ideas of his time and his country. Norman Denzen writes "Schools teach social rules, rituals and also submission to higher authority."
- **Peer Group:** It is the group of people of same age groups and also of the people of same interests and same activities. Such groups are developed in schools and the neighbourhoods. Through this process a child learns from his playmates the values and norms of the other families which facilitate him to understand society as a whole.

Community: It is the biggest agency of civilization. Following agencies of community are important:

- The mosque, *Eid gah* etc.
- Political parties and their efforts.
- Seminars and discussions.
- Hotels, marriage ceremonies etc.
- Recreational agencies like cinema, theatre, drama, radio etc.

iv. Means of communication

It includes mass media, press etc. In a nutshell we can say:

- They inform, entertain and educate the people.
- They influence their attitudes, values, fashion, taste etc.
- They are stronger source of social power and social cohesion.

v. Means of socialization

Those sources through which people are socialized. These means include imitation, suggestion, experiments, adjustment, social control and also vanity.

vi. Socialization is fundamental to every society

Joel M. Charon in his classic work "Sociology - A Conceptual Approach" refers his ideas in the support of the statement. No society can avoid socialization for its very survival and therefore it is fundamental to every society.

vii. Socialization varies from society to society

Every society tends to socialize its members according to its own cultural patterns, value systems and normative orders. For examples, the accepted ways in the Pakistani society may be the rejected in American society. Though "Purda" is accepted in Pakistani society yet it is rejected in American society.

viii. Importance of socialization

- It is important for our survival.
- It helps learning of human qualities.
- Socialization produces personality.
- It shapes each individual person.
- It is helpful in learning language.
- Groups like family, friends and neighbourhoods make possible human nature.

Scanned with CamScanner

CHAPTER 5

SOCIAL INSTITUTIONS

1. DEFINITION

Bertrand defines it as "system of social relationship for meeting various felt human needs."Maciver and Page consider it "an established forms or conditions of procedure." H.E Branes interpreted it in these words: "social institution is the social structure and machinery through which human society organizes, directs, and executes the multifarious activities required to satisfy human needs." In general, we may infer that social institution is an established machinery to satisfy human needs.

2. TYPES OF INSTITUTION

Following are the types of social institutions.

- Family
- Religious institutions
- Political institutions
- Recreational institutions
- Educational institutions
- Economic institutions

Family

1. INTRODUCTION

Horton & Hunt: "family is a kinship grouping which provides for the rearing of children and for certain other human needs."

In the primitive society, family was a source of authority. Council of elders in the primitive times exercised great influence within the family and the society.

Structure of the family: The folfowing relationships exist in a simple family when there are children with parents:

1. Husband & wife **2.** father & son **3.** father & daughter **4.** mother & son **5.** mother & daughter **6.** brother & brother **7.** sister &sister **8.** brother & sister

These bonds of relationship create structure of the family. These members compose a family.

2. TYPES OF FAMILY

- **Nuclear conjugal family:** This consists of married couple and their unmarried children living together. Husband & wife make core in this family. Redcliff Brown called it elementary family.

  In Pakistan society nuclear family is very popular especially in urban areas.

- **Consanguine family:** This family is founded upon blood relationship of a large number of kin relationships. This family is extended to blood relatives together with their mates& children. It is the main basis of kinship

  In Pakistani society unmarried brother and sister live together with parents. It means uncle and aunt also live together within the nuclear family. Practically it is found today in Pakistani society where father is strongly dominant.

- **Extended Family:** It consists of three generations. Grandfather, father and son living within the family are a typical extended family. The three kinds are:
  - **Extended Family:** Husband & wife and their either of the married children living together.
  - **Patrilineal Extended Family:** parents + their sons + sons' wives and their children living together.
  - **Matrilineal extended Family:** parents + their daughters + daughter's husbands + their children living together.

  In Pakistani society, they are usually called 'gharJawai'

- **Matrilocal Family:** Mother + her children without husband – father. It is also called maternal family or simply mother child unit.

  In Pakistani society there is no such customary family found but in odd circumstances when father dies or divorces his wife or gets into another marriage and lives with her. In this case the mother dos not remarry but lives with her children only.

- **Stem Family:** Parents + one child + his spouse + his /her children. In Pakistani society this family is found from place to place. The parents marry all their children and give them separate living and continue to live with one married son or daughter usually the youngest one.
- **Single parent family:** Where husband or wife are looking after their children.
- **Blended Family:** Where husband or wife contracts another marriage. For example, husband having two wives (polygamous wives)
- **Cohabitation:** It is recognized in the west but not in the Muslim countries. Prof. Cretnery in 'Family Law' has called such marriages as 'trial marriages'
- **Patrilocal Family:** Married couple live with the husband's family.

3. MARRIAGE

Horton & Hunt: "Marriage is a culturally approved social relationship for sexual relationship and child bearing"

Marriage may be either monogamous (only one mate at a time) or polygamous (more than one wives). Polygamous has two types:

Scanned with CamScanner

- **Polyandry:** In this type woman is allowed to have more than one husband.
- **Polygyny (polygamy):** In this type, husband contracts marriage with more than one wife.

There are also group marriages in some societies.

4. Functions of Family as an Institutions

Following are the functions of family institution.

- **Socialization:** The child learns socialization from the parents. The realizations of 'self' among children also takes place through their interaction in the family.
- **Care for old dependents:** Is also one of the main duties of family both in normal & abnormal circumstances.
- **An outlet for sex:** It regulates the sexual behaviours on standardized patterns for the married adults.
- **Selection of mates:** is also done by family. The ultimate aim of this is to provide happy life to each family member. Divorces in most of cases are decided by the family.
- **To inculcate love & Affection among family members:** is one of the most distinguished functions of family.
- **Reproduction** By choice of mates, reproduction takes place.
- **Economic unit:** The family is responsible for the preparation of budget and its implementation. The members of family get food; shelter, clothing etc. through this unit.
- **Rules of descendants and right of property:** Family institution determines line of descendants and the right of property among the members of family. These norms are given a legal shape.
- **Education:** Formal and informal, religious or secular education of children is in fact the responsibility of the family.
- **Political:** During election, members of the family are united for a single candidate under the leadership of their family head.
- **Recreation:** The arrangements of recreational and amusement activities are also functions of the family.
- **Social control:** Family enhances social control.
- **Religion:** Family teaches the members about right and wrong ideas for family, community, country and humanity. It helps in character making.
- **Health coverage to children:** It is also the duty of family institution to look after health of every member of the family.
- **Social status:** Social status and legitimacy of status is determined by family.

5. Effects of Urbanization and Industrialization on Family

It adversely affected the institution of family in the present age.

- Urbanization & Industrialization have changed the structure and functions of a traditional family. Family is now nuclear family
- Kinship has become weak. Now family gets help from a stranger or some other individual. Now members of nuclear family believe in and strive for 'achieved status'

- The educational institution plays a great role in character building process of children. Now role of family is limited.
- Children hardly get due love and affection from their busy parents.
- Birth control policy is widely publicized and acted upon by nuclear family.
- Both husband and wife are engaged in the job. The traditional role of mother has been changed. She is a bread winner for the family. She has economic role to play to increase financial income of family.
- Violence against children and women has increased manifold within the family because of many factors. It is mainly due to frustration amongst the spouses.

Endogamy Practice of choosing mates within some specified group.

Exogamy Practice of choosing mates outside some specified group.

Religious Institutions

1. Introduction

Prof. C.H. Page "*Religion is the basic social institution. Religion is a social institution in USA.*"

Prof. D.M. Newman "*Religion leads to socialization.*"

Emile Durkheim "*The unified system of beliefs and practices related to sacred things.*"

"Religious institution is a system of beliefs and practices influencing human events where man is helpless to explain them."

Religion is a universal phenomenon. It fulfils human needs.

2. Elements/ Structure of Religious Institutions

Religion has following elements in structure.

i. **Beliefs** are sacred and are considered true. They belong to faith not to reason. Belief in God, the Doom's Day, life after death, the Angels, the Prophets, Sacred books, good and bad luck are the elements of 'faith' in Islam.

ii. **Rituals/ceremonies** are the sacred and accepted values. In Islam, prayers to God, animal sacrifice on Eid-ul-Azha, the activities of *Haj*, making ablution, recitation of the Holy Quran are the religious rituals. The Holy Quran, mosque and Baitullah are the sacred objects of Islam.

iii. **Emotions** The rituals produce emotions of hope, fear, reverence and humility.

iv. **Religious organizations** Without organization, no religion can survive. There are prophets, followers, mystics, imams or priests, *talibs*, *pirs* etc.

v. **Sacred objects** Those objects which are regarded as holy. For instance, cows, temples, and idols are sacred for the Hindus, Cross, Church and Bible for the Christians. Quran, mosque, Baitullah etc. are sacred for the Muslims.

vi. **Symbolism** It is a sign for an object or situation. It may be expressive like flag, salute and verbal like Azan etc. The Baitullah and mosque are symbols of God and not God themselves. The Quran is also a symbol of words from Allah. Sacrifice of animals on Hajj

Scanned with CamScanner

is a symbol of sacrifice of Son made by Hazrat Ibrahim. Offering prayer is a symbol of humility before Allah.

vii. **Sect** Every religion has small groups of followers differing from the main religion called sects. Among Muslims there are Shia, Sunni, Deobandi and Ahle-Hadith. Among Christians there are Catholics, Protestants and others. Every sect claims to be true but only one of them is on the path of righteousness. Every religion has more than one body of believers grown up within the larger religion.

3. Forms of Religion

There are different forms of religion, some are:

i. **Animism:** There is belief in spirits and ghosts, who bring good or bad luck for the individuals. For instance, animals and trees are thought to be the main bodies for changing human life.

ii. **Mana:** In this form of religion, the belief is that certain men are gifted with impersonal power through supernatural beings.

iii. **Theistic system:** It is a belief in one God. Islam is the religion based on Tauheed.

iv. **Religion is not unscientific:** but one can attribute it to be non-scientific due to the reason that the phenomenon with which religion deals is beyond the jurisdiction of science. In religion, there is a value judgement without any rational thinking.

v. **State and Religion:** The legal structure of the government is usually based upon the religious ethics. Both cannot be separated from each other. The most of states are becoming secular these days.

4. Functions of Religion

i. **Religion removes fear and anxiety:** Quran says "don't lose hope from the mercy of God." Recitation of the Holy Quran, offering prayers and adopting patience remove fears and anxieties and provide a peaceful life.

ii. **Relation between man and the universe:** Religion provides norms as how to know this universe and utilise its resources for the welfare of humanity. Quran reveals "we conquered for you all whatever is in the earth and the sky."

iii. **Relationship between man and God:** It creates deep relationship between man and the creator God. This relation was created by prophets of God. They preached. They terrified of hell to those who did not obey their lord.

iv. **Judgement of right and wrong:** Islam divides actions in two categories. The right acts lead to heaven and wrong acts to hell.

v. **Preservation of values:** It preserves social and cultural values. Acts contrary to Islamic values are forbidden and condemned in society. Sanctity of women, respect for *ramzan*, Quran, mosque and elders are the important socio-cultural values.

vi. **Religion creates purity and cleanliness:** It creates physical and social cleanliness. All religious objects are pure like mosque and the Quran. An unclean person and an infidel is not allowed to enter the mosque or touch the Holy Quran. Cleanliness of thoughts and actions is created besides that of body, building, food and cloths.

vii. **Religion is a socializing institution:** During Tafsir-i-Quran and Hadith and the interpretation of Fiqah the social issues and conditions come under discussion.

viii. **Religion creates social solidarity:** Religion is a binding force among individuals and groups. It creates harmony of attitude, ideas and habits among its followers. Various Islamic conferences are result of it.

ix. **Religion relates man to man:** It teaches respect for other's life, honour, property and freedom. For security of lands and defence service, Jizia is taken as payment for security. Religion is no barrier between man and man in trade, education, technology, sports, recreation and politics.

x. Religion is an instrument of sacred control, mutual co-operation and group feelings.

5. Religion and Economy

The economic institutions use the norms of Islam as: (1) Do not weigh less. (2) Don't deceive others (3) Don't tell a lie. (4) Don't go back on your promise. (5) Return the 'Amanat' to their owners. (6) Don't take usury (interest). It is totally *haram* (unclean) (7) Don't steal other's property. (8) Don't hoard food grains with the aim to sell on higher rates.

6. Conclusion

Religion certainly contributes to lessen the degree of insecurity, lawlessness, disorder, disorganization at the individual, group, institutional and societal level. There are symptoms of revival of religious forces even in highly urbanized industrialized societies today.

Political Institution

1. Definition

Gillin and Gillin say that the state is the sovereign political organization of the individuals occupying a definite territory.

The political institution may be defined as a set of norms pertaining to the distribution of power and authority concerning the management and control of society to bring order in life. The political institution is present in every community and country. The examples of political institutions are "Jirga". Kinship, Union Council, Town Committee, Provincial and National Assemblies, High Courts and Supreme Court and executive aspects of Government.

2. Structure of Political Institution

- **Formal and Informal**

A political institution can be formal as well as informal like "*baradari*" system and Union Councils. In an informal institution the effectiveness and popularity of the decisions of a leader (leader in the real sense and not an imposed leader) is usually higher in comparison to the decisions taking place in a formal institution. There are fixed power and authorities of the individuals in a formal institution. There are set procedures and methods for action. The range of government activities is very wide. From local self-government to the federal government, degree of power and authorities vary at each level.

Scanned with CamScanner

In simple and folk societies more and more human activities are controlled and defined by the informal organizations, which have a strong grip over individual behaviour. Usually, there is one man or organization of more than one person, who enjoys the supreme power in a country. The supreme power delegates some of its powers to the administrators at lower levels for bringing an orderly life in the country. Generally, there are three main branches of the government, i.e.

- Judiciary,
- Executive, and
- Legislation.

These three branches are responsible for making laws, their enforcement and to decide any conflict that occurs. These branches of government are found in every ongoing society.

3. Functions of Political Institution

Government's job is to maintain social control through prevailing norms resulting in social solidarity arid national unity However, there are two types of function so far as peace and security of society is concerned, i.e., internal and external functions.

Internal function is that a government manages to maintain law and order by making provisions for the protection of individual and their property. The rights for the utilization of property are maintained in such a way that there is least clash of interests in society. On the other hand, the function of the government (external function) is to protect individuals from outside dangers, or aggressions and calamities through diplomacy, war or any other method.

Functions of political institutions are increasing everywhere in the world with the passage of time. Most of the functions of other institutions are being performed by the political institutions, because of their supremacy over other institutions. For example, care of the sick people (through hospitalization), education of the children, price fixation, credit facilities, settlement of disputes about property and ownership, land reforms, consolidation of landholding, trade, commerce, transportation, communication, banking, family laws, divorces and their implementation fail within the jurisdiction political institutions.

Recreation was previously one of the functions of religious institution, as fairs and religious ceremonies for the enjoyment of people, are now being taken over by the government In most of the cases government organizes such recreational activities as subsidized rates. For instance, government arranges public galleries, art councils, and major games like football, hockey and cricket. Film industry is also being encouraged and efforts are being made by government to provide financial help and chances of healthy competition among producers of the films. Efforts are made that the individuals spend their surplus energies in a socially sanctioned manner.

During war, or under such other abnormal circumstances, government controls all the resources of the country and other social institutions become subordinate to it. It is observed that there is a trend towards decentralization of powers in a political institution. This is not true during the abnormal circumstances, as was the case with wars between India and Pakistan

Functions of political institution are not restricted to a particular class or group, but these cover even the activities of an average man living in the country whether in far-flung rural areas or in the federal city

The political system effects the social stratification and economic systems, i.e. economic activities of people and the degree of public participation in governmental activities are determined by the political system. It safeguards the interest of a common man. His fundamental or basic rights as a citizen and to provide social justice so everyone in their daily life. The degree of participation in government affairs and expression of opinion varies from a democratic country to a country where (here is dictatorship. This also affects the formation of an average personality, cultural and intellectual achievements of people. The progress of the country, as a whole, is also affected by the prevailing political system.

The Government collects its revenue through taxation to meet its requirement and runs its administrative machinery efficiently. Rest of the money is spent on public welfare and for the betterment of the citizens. Thus, people's welfare is becoming one of the major aims of every modern state. There is a trend all over the world to develop democratic welfare state for a country

There is a trend for international political organizations like United Nations, so as to enable the weaker nations to get protection, equality and rights of representation in world affairs. Efforts are being made to solve the various issues faced by the humanity and to bring peace and order in the world with least possible element of aggression and frustration among the nations of the world.

Economic Institution

1. Definition

Prof. Page asserts: "An economic institution is the social & cultural system of society directly concerned with the production, distribution and consumption of goods and services."Its principal function is to provide the means whereby members of a society may survive and maintain themselves.

An economic institution is the set of norms relating to production and distribution of goods and services. The economic institution is concerned with both actions and thoughts which are deeply rooted in group habits and customs of the people. Economic institution is an aspect of material culture too, which is very important in the world of today. It is important and significant in the life of almost every community. The roots of economic institution can be traced in the group habits, as all the activities of individuals in respect of production, consumption, exchange and distribution of goods and services are approved or unapproved ways of society.

Economic growth and development has changed the patterns of interaction of people all over world. It has shaken the existing personal security, concept of profit and income and has changed the human behaviour towards life and human relationship itself. It is true both in agricultural and industrial economics. It has also changed the market structure, economic organization and has created division of labour. Banking, insurance, trade, commerce, ownership and use of landed property are the examples of economic institutions which are present, mostly in every ongoing society.

2. Structure of Economic Institution

The structure of economic institution is discussed in the following lines:

i. **Economic System:** There is economic system and almost every society has developed a system based on some ideology by which control and use of capital goods and services is

Scanned with CamScanner

determined. Whether it is totally in the hands of government or private individuals, or in between the two extremes-government and individuals. For example, there are communistic, capitalistic, socialistic or such other forms of economy.

ii. **Division of Labour:** The most prominent feature of an economic structure is that there is a division of labour. Division of labour is the most significant feature of industrial economy where specialization and interdependence are the most essential features. It has made the economic activities of the individuals most efficient and organized.

iii. **Competition and Monopolistic Mode of Production and Distribution:** The economic structure provides format and informal norms for the production and distribution of goods and services along with their prices either based on perfect competition, imperfect competition, or monopoly in a society.

iv. **Mass Production:** Mass production is becoming an outstanding feature of the modern economy and the entire world is becoming the market for the consumption of economic goods and services. This tendency is growing every day, following the principle of comparative costs and natural endowments theory.

v. **Economic Organization:** There are different economic organization in primitive, agrarian, and industrial societies, which give different roles and statuses to the members of society. Methods of production, exchange and distribution of economic goods and motives of people engaged in such activities are according to the economic organizations. For example, trusts, partnerships, and such other organizations are gaining popularity now-a-days.

vi. **Role of Technology:** Technology is being introduced every day with greater speed in almost every field of economic activities all over the world. Economic institutions is quite ahead of other social institutions in the use of technology.

vii. **Government Control:** In most of the cases, there is profit motive and entrepreneurial freedom for the individuals both in theory and, to some extent, in practice The entire authority to regulate the economic structure of different countries of the world, in most of the cases, is in the hands of their respective governments. The interrelationship of economic structure with other social institutions is very vital and important, as changes in economic institution are followed by major changes in the rest of the social institutions.

3. Functions of Economic Institutions

The functions of economic institutions are enumerated as under:

i. **To control and regulate capital goods and services:** The most important function of an economic institution is to regulate and control the capital goods and services in a community or society. Such a control and regulation is simple in folk societies, while quite complicated in industrial societies.

ii. **Necessities and luxuries:** Economic institution provides necessities, comfort and luxuries to the individuals on a set pattern, which is a high developed system in itself.

iii. **Division of labour:** Division of labour is the outcome of the modern economic structure in which independence and specialization have taken such a shape where a single individual has to learn and pass through only a segment of processes of production, distribution and exchange of economic goods. This division of labour has given different roles to different individuals, which has resulted in a chain of complex human behaviour.

The functions mentioned above are the manifest functions of the economic institution. Apart from these, there are latent functions too, which are enumerated as under:-

a. **Distribution of power:** all those persons, who belong to higher economic status, are given priority in all walks of life in comparison to the poor, or people who are economically unsound. Pressure groups which influence even the government decisions in judiciary, executive, and legislative branches are the outcome of economic status of the individuals. There is distribution of power and authority among various classes, which is applicable, both in industrial and agricultural societies. The individuals are not treated equally. There is discrimination among people belonging to various classes.

b. **Stratification:** The repercussion of distribution of power and authority based upon the economic status of an individual in a given society affects individuals in a different way. There are landlords, industrialists, employers, while other are tenants, labourers, and employees. The latter are not definitely equal to the former in their social status. They are unable to get what they aspire to achieve. It becomes impossible in the presence of restricted choice in occupations and ownership of property

c. **Independence of economic structure:** Economic structure is very much interdependent on other social institutions like political, family, and educational. Now-a-days even nations are not independent in this respect, because they have to look for other nations for raw material, finished goods, and have to search out new markets in the world for exploring foreign market.

d. **Determining socio-economic status:** The levels of achievement of economic goods and services by an individual help the economists to determine one's socio-economic status through one's possession of amenities and luxuries in a given society at a given time.

e. **Inheritance of property:** The economic institution is also responsible for the distribution of property and determines inheritance. Ownership and rights for the use of property are also determined by this institution.

f. **Personality formation:** The economic position of an individual has a strong hold over the roles of an individual in a society. This is true in the case of nations, as economically sound nations enjoy superiority over under-developed counties. An individual develops most of his personality traits, which are associated with his occupation and economic status in society. Generally, the people belonging to different occupations have identical personalities.

g. **Political hold:** The higher economic status is very closely associated with greater political hold. This usually stands valid in every society. The nations which enjoy higher and sound economic position in the world dominate in political life.

Educational Institutions

1. Aims of Education

There are three basic aims of education which were put up by Socrates in 5th century B.C. These views shaped the classic Greek view of knowledge and education:

- Education is the development of power to think and not the acquisition of information.
- Education is a search for 'virtue' and truth rather than technical proficiency.

Scanned with CamScanner

- Education looks to lasting truth, based on reason not to mere opinion or the practical knowledge. John Dewey added that education is the reconstruction of experience.

2. STRUCTURE

- **Formal Education:** Formal educational processes make deliberate, organized and conscious effort to impart knowledge including science both in theory and practice. We find this system prevailing in our schools, colleges and universities.
- **Informal Education:** includes press, radio, television, advertisements and other media of communication through which culture is transmitted to a person.

3. EDUCATION PROCESS

- **Education system:** Informal aspect is usually based on some ideology and philosophy of life. This system is to give an individual a typical way of living covering both material and non-material aspects of life.
- **Means of Education:** Whether it should be formal or informal
- **Type of Education:** It can be religious or secular, technical or general, progressive or traditional and liberal or conservative. Different societies have special emphasis on a particular type of education.

4. MAIN FUNCTION OF EDUCATION IN PAKISTANI SOCIETY

- **Cultural transmission:** The system of education transmits our cultural values to the next generation. During education the following three processes take place.
  - **a.** The teacher learns himself as experience.
  - **b.** Teacher changes education by applying his experiences.
  - **c.** Teacher changes students by teaching them.

The ways of life of our ancestors are handed down to coming generations through education. It is transmitted to next generation with changes after research.

- **Social integration:** Education creeds social organization in society by harmonizing the attitudes, ideas, habits, customs, emotions and sentiments of people. It develops homogeneity by developing general laws of social life. Different social groups are organized together on the co-operation of common principle found in education.
- **Future occupation:** It is a guide line of social life. It provides methods to acquire information on various aspects of life.
- **Techniques of learning skills:** Education enables man to learn the techniques of the profession he has adopted. Education provides facilities for one who wants to study medical, engineering or legal knowledge. It is a weapon by which an individual can gather the technical skills of his profession.
- **Socialization:** Education itself is a process of socialization. It changes those who receive education. It develops personality traits among students.
- **Rational Thinking:** It makes man to think rationally. He can see the cause of an event and understand the situation clearly.
- **Personal Adjustment:** By education an individual makes personal adjustment with the environment in which he lives.

- **Family living:** Education trains man how to live in family. He knows the status of the members of his family. Marriage, marital roles, children and the role of fathers all get into his knowledge and he lives a successful life
- **Patriotism:** Patriotism develops through education in the young generation. The children recognize themselves and their duties toward nation.
- **Character Building:** They learn the social and cultural values and become useful members of society. The character is morality which is transmitted through education.

5. PROBLEMS OF EDUCATION AND INSTITUTIONS

The following are the major problems of education and its institutions in Pakistani society:

i. **Poor standard of Education:** Most of the students who pass the examination fall in 3rd division. Only a few percent get 1st and 2nd division in higher education of college and university.

More than 70% of the total fails in the examination. Moreover those who clear they make several attempts in several years.

Those who clear without failure throughout their education career form a very minute ratio in the whole. Mostly failure is because of poor standard in education.

- **Causes**
  - Role of teachers are not satisfactory.
  - The parents pay little attention to their children at home. They consider themselves free from this duty.
  - Response of community is not favourable Radio, TV, papers, Books, celebrations, associations, attract the attention of students and they get off their studies.
  - The students cannot be blamed because they have always been in the hands of above three agencies that could mould them as useful as they could.

ii. **Illiteracy:** An illiterate person can neither understand the problems and new trends of social life nor can follow them. He remains backward and the standard of living remains low.

An adult education is launched by government. The policy is facing serious problems in rural areas. Adult students find little time to attend to the teacher all at a time and at one place.

iii. **Unrest among students**: Following are the reasons:

- **Lack of leadership** The students experiencing readership through mass behaviour had experienced dissatisfaction in the socialization of their early child hood. Dissatisfaction leads to frustration.
- Dissatisfaction from teachers and college administration: Also add to their unrest condition.
- Students' loss of hope of Success in examination: Diverted toward mob activities.
- **Politics:** The students, who get into politics, pay little attention towards study and become active workers of politics.

CHAPTER 6

SOCIAL & CULTURAL CHANGES

1. Social Change

It implies alterations and modifications in social structure, social relationship and social organization. It is a change in group life and their conditions of living. It results from new discoveries and inventions.

For instance, our forefathers used to live in house made up of clay; their occupation was mainly based on agriculture: and they usually travelled on animals. But we live in well decorated and well-designed house of bricks and marbles. We travel in cars, aeroplanes, trains and our occupation has many varieties; it is social change.

2. Cultural Change

It implies changes in culture and its component parts. It refers to alterations in behavioural patterns, value systems, normative orders, style and faction of things etc. in a society.

For instance, changes in hair styles, dressing, mode of marrying, manner of talking, walking, eating, sleeping, thinking etc, all are parts of cultural change. Besides this new style in architecture, new forms of literature, new innovations in arts, new models of automobile etc. are some of the examples of cultural change.

3. Difference between Social Change and Cultural Change

Social Change	Cultural change
It takes place in social structure, Forms of relationship and group life.	It occurs in culture, beliefs, values, norms, institutions, attitudes etc.
It affects occupation, income, living standard, role and status of individual in a society.	It affects their code of ethics, approach towards religion, form of learning, ideologies of govt. etc.
These are minor with short and simple processes	They are time taking, complex and complicated
It is caused by factors as population changes, social structure and cultural base.	It is mainly by invention, discovery and diffusion.
Introduction of radio, TV, computers etc. is a social change.	While learning to operate them or what result, they teach us.

4. From Social to Cultural Change

For instance, when a clerk becomes an officer, it is a social change. However, when he learns to behave and interact like an officer, it becomes cultural change.

5. From Cultural to Social Change

For example, it is always human ideas and knowledge which produce the inventions of new instruments such as computer, TV etc. whose introduction constitute social change.

The changes always overlap each other. Their effect on society is integrated and unified like a complex whole.

6. Process of Socio Cultural Change

William F Ogburn was the first scholar to make a detailed study of the process of social change which is as follows:

- **Discovery:** "It is a shared human perception of an aspect of reality which already exists". It is addition to the world's store of verified knowledge. Columbus discovered America.
- **Invention:** "It is a new combination of existing knowledge' Material inventions like TV, telephone etc. and social inventions like alphabet, constitutional govt or the corporation are classified.
- **Diffusion:** "it is the spread of cultural traits from one group to another or form one society to another".

For instance, Europeans gave horse, firearms, Christianity, whisky and small pox to Indian in exchange of corn, potatoes, tobacco etc. this process also enriches societies and culture.

7. Factors which cause Process of Socio Cultural Change

Discovery, invention and diffusion are processes of change. Their causes are:

- **Physical environment:** As people migrate from barren area to prosperous areas.
- **Population changes:** are itself social changes but become a factor in further socio cultural changes rural urban migrations etc.
- **Isolation and Conduct:** isolated as are less prove to change they are stable, conservative and resistant to change. While well contended societies are tended to change more liberal and assimilating.
- **Social structure:** societies where cultures are more integrated family, religion and other institutions depend more on each other change is difficult and costly. While where culture is less integrated change is easier and more frequent.
- **Attitudes and Values:** Some people anticipate and appreciate change while others not.
- **Perceived needs:** Changes occur when people feel their need otherwise difficult.
- **The cultural Base:** Accumulation of knowledge and technique available to the inventor is cultural base. As cultural base grows, an increasing number of inventions and discoveries become possible.

Scanned with CamScanner

8. FACTORS WHICH PROMOTE & HINDER SOCIAL CHANGE

Discovery, invention, and diffusion are processes of change. But what causes them to happen? We cannot answer this question without first examining the meaning of the term cause. A cause is sometimes defined as a phenomenon which is both necessary and sufficient to produce a predictable effect. It is necessary in that we never have this effect without this cause, and sufficient in that this cause, alone, always produces this effect. Thus defined, very few causes have been established in social science. Does drunkenness cause divorce? Many spouses endure a drunken mate, while others divorce mates who are bone – dry. Obviously, drunkenness is neither a necessary not a sufficient condition to produce a divorce. Most causation in social science is multiple - that is, a number of factors interact in producing a result. What factors interact in producing a social change?

First of all, we note that the factors in social biological or geographic. Not everyone accepts this view. Some people would attribute the rise and fall of great civilizations to changes in the biological characteristics of nations. Often these theories have a racial twist; a great civilization is said to arise from a vigorous, creative race and to fall when the race mixes with lesser breeds and dilutes its genius. According to an opposite version, a great burst of creativity following a fortunate intermixture of races and dies out as the hybrid strain runs, out Most scientists reject all such theories. During the period of recorded history, our biological attributes appear to have been a constant, not a variable, in human behaviour.

i. Physical environment

Major changes in the physical environment are quite rare but very compelling when they happen. The desert waster of North Africa was once green and well-populated. Climates change, soil erodes, and lakes gradually turn into swamps and finally plains. A culture is greatly affected by such changes, although sometimes they come about so slowly that they are largely unnoticed. Human misuse can bring very rapid changes in physical environment which, in turn, change the social and cultural life of a people. Deforestation brings land erosion and reduces rainfall; overgrazing destroys the vegetation cover and promotes erosion. Much of the wasteland and desert land of the world is a testament to human ignorance and misuse. Environmental destruction has been at least a contributing factor in the falloff greatest civilizations.

Many human groups throughout history have changed their physical environments through migration. Especially in primitive societies, whose members are very directly dependent upon their physical environment, migration to a different environment brings major changes in culture. Civilization makes it easy to transport a culture and practice it in a new and different environment. The British colonial in the jungle outposts usually took afternoon tea and dressed for dinner. Yet no one would suggest that people were unaffected by the jungle environment; all cultures are affected by change of physical environment.

ii. Population changes

A population change is itself but also becomes a casual factor in further social and cultural changes. When a thinly settled frontier fills up with people, the hospitality pattern fades away, secondary - group relations multiply, institutional structures grow more elaborate, and many other changes follow. A stable population may be able to resist most change, but a rapidly growing population must either migrate, improve its productivity, or starve. Great historic migrations and

conquests - of the Huns, the Vikings, and many others - have arisen from the pressure of a growing population upon limited resources. Migration encourages further hand, for it brings a group into a new environment, subjects it to new social contacts, and confronts it with new problems. No major populations change leaves the culture unchanged. As this is written, many scholars are gravely wondering whether overpopulation or nuclear war is the more likely to destroy modern civilization.

iii. Isolation and contact

Societies located at world crossroads have always been centres of change. Since most new traits come through diffusion, those societies in closest contact with other societies are likely to change most rapidly. In ancient times of overland transport, the land bridge connecting Asia, Africa, and Europe was the centre of civilizing change. Later, sailing vessels shifted the centre to the fringes of the Mediterranean Sea, and still later to the northwest coast of Europe. Areas of greatest intercultural contact are the centres of change War and trade have always brought intercultural contact, and today tourism is adding to the contacts between cultures.

Conversely, isolated areas are centres of stability, conservatism, and resistance to change almost without exception; the most primitive tribes have been those who were the most isolated, like the polar Eskimos or the Aranda of Central Australia. Even among "civilized" peoples, isolation brings cultural stability. The most "backward" American groups have been found in the inaccessible hills and valleys of the Appalachians.

Ethnic enclaves, whose isolation is social and voluntary rather than geographic, show a similar conservatism, whether it be Americans in Spain, Amish in America, or Tristan Islanders in England. Isolation invariably retards social change.

iv. Social structure

The structure of a society affects its rate of change in subtle and not immediately apparent ways. Lnkeles and Smith conducted in _ depth interviews in six developing countries, seeking to find out what made some persons receptive to change. They found that some persons had" a general modernity syndrome" and that such persons were likely to have worked in a factory, to have had several years of education, and to read newspapers.

A society which vests great authority in the very old people, as classical China did for centuries, is likely to be conservative and stable. A society which stresses conformity and trains the individual to be highly responsive to the group, such as the Zuni, is less receptive to change than a society who are highly individualistic and tolerate considerable cultural variability.

A highly centralized bureaucracy is very favourable to the promotion and diffusion of change, although bureaucracies have sometimes been used in an attempt to suppress change, usually with no more than temporary success.

When a culture is very highly integrated, so that each element is rightly interwoven with all the others in a mutually interdependent system, change is difficult and costly. Among a number of Mitotic African peoples, such as the Pakot, Masai, and Kipsizis, the culture is integrated around the cattle complex, Cattle are not only a means of subsistence; they are also a necessity for bride purchase, a measure of status, and object of intense affection. Such a system is strongly resistant to social change. But when the culture is less highly integrated, so shat work, play family, religion, and other activities are less dependent upon one another; change is easier and

Scanned with CamScanner

more frequent. A tightly structured society, wherein every person's roles, duties, privileges, and obligations are precisely and rigidly defined, is less given to changes that a more loosely structured society, wherein roles, lines of authority, privileges, and obligations are more open to individual rearrangement.

v. Attitudes and values

To westerners change is normal, and most of them pride themselves upon being progressive and up to date. Children in Western societies are socialized to anticipate and appreciate change. By contrast, the Trobriand Islanders off the coast of New Guinea had no concept of change and did not even have any world in their language to express or describe change. When Westerners tried to explain the concept of change, the islanders could not understand what they were talking about. Societies obviously differ greatly in their general attitude toward change A people who revere the past, worship their ancestors, honour and obey their elders, and are preoccupied with tradition and rituals will change slowly and unwillingly. When a culture has been relatively static for a long time, the people are likely to assume that it should remain so indefinitely. They are in tensely and unconsciously ethnocentric, they assume that their customs and techniques are correct and everlasting. A possible change is unlikely even to be seriously considered. Any change in such a society is like to be too gradual to be noticed.

A rapidly changing society has a different attitude toward change, and this attitude is both cause and effect of the changes already taking place. Rapidly changing societies are sceptical and critical of some parts of the traditional culture and will consider and experiment with innovations. Such attitude powerfully stimulates the proposal and acceptance of changes by individuals within the society.

Different groups within a locality or a society may show differing receptivity to change. Every changing society has its liberals and its conservatives. Literate and educated people tend to accept changes more readily than the illiterate and uneducated. The Amish in the United States have resisted change of nearly every kind except, sometimes, in farming techniques. Although the Amish may never have heard of the "integration of culture," they realize that if their young people had easy access to movies, television, motorcycles, and fast food, their traditional values would soon fade.

A group may be highly receptive to changes of one kind and resistant to change of other kinds. The Amish quickly. Accepted new farming procedures (seeds, crop breeds, crop rotation, and field management), slowly accepted new farm machinery, and rejected practically all new consumer products. Many Religious groups readily accept new church architecture but not new religious doctrines. Some changes are more threatening to a group's major values than are other changes.

Attitudes and values affect both the amount and the direction of social change. The ancient Greeks made great contributions to art and learning but contribute little to technology. Work was done by slaves; to concern oneself with a slave's work was no proper task for a Greek scholar. No society has been equally dynamic in all aspects, and its values determine in which areas - art, music, warfare, technology, philosophy, or religion - will be innovative.

vi. Perceived needs

A society's rate and direction o change are greatly affected by the needs its members perceive. "Needs" are subjective; they are real if people feel that they are real. In many

underdeveloped and malnourished parts of the world, people not only have objective needs for more food, they also need different foods, especially vegetables and legumes. Agricultural changes which bring more food are more readily accepted than those bringing different foods, for which they feel no need. Until people feel a need they resist change; only the perceived needs of a society count.

It is often stated that changing conditions create new needs-genuine, objective needs not just subjectively "felt" needs. Thus urbanization created a need for sanitary engineering; the modern factory system created a need for labour union; and the high-speed automobile created a need for superhighways. A culture is integrated, and, therefore changes in one part of the culture create a need for adaptive changes in related parts of the culture.

It is doubtless true that failure to recognize an objective need may have unpleasant consequences. For centuries, sickness and death were the price of our ancestors' failure to recognize that urban growth made sewers necessary. A more recent failure to recognize that death control creates a need for birth control has brought half the world to the brink of starvation. All this does not alter the fact that it is only those "needs" which are perceived as needs which stridulate innovation and social change.

The concept of perceived need as herein outlined is largely a functionalist concept. Functionalists see many "needs" as objective realities growing from survival necessities from the constant development of new technology. Conflict theorists would reply that a majority of skilful promotion by those who profit from creation and then meeting them Thus we "need" new gadgets because they are cleverly advertised, and we "need" trillions for defence because the military industrial complex finds it profitable in money and power to prom to war scares and international tensions. The disagreement is one of emphasis. Both functionalists and conflict theorists agree that some "needs" are created and some are objective necessities.

Necessity, however, is no guarantee that the needed invention or discovery will be made. At present, we perceive that we need pollution free power source, and effective disposal of nuclear wastes. There is no certainty that we shall develop any of these. Necessity may be the "mother of invention," but invention also needs a father-a cultural base to provide the necessary knowledge and technique.

vii. The cultural base

Prehistoric cave dwellers could make exceedingly few material inventions, for they had very little to work with. Even the bow and arrow include a number of inventions and techniques - notching the bow ends tying the bowstring, hafting and pointing the arrow, plus the idea and technique of shooting it. Not until these components were invented was it possible to invent the bow and arrow. By the cultural base, we mean the accumulation of knowledge and technique available to the inventor. As the cultural base grows, an increasing number of inventions and discoveries became possible. The invention of the geared wheel provided a component which has been used in countless inventions. The discovery of electromagnetism and the inventions of the vacuum tube, the transistor, and the microchip provided necessary components for hundreds of more recent inventions.

Unless the cultural base provides enough earlier inventions and discoveries, an invention cannot be completed. Leonardo da Vinci in the late fifteenth century sketched many machines which were entirely workable in principle and detail, but the technology of his day was incapable

Scanned with CamScanner

of building them. His drawings for the aerial bomb, hydraulic pump, air conditioning unit, helicopter, marching hum, military tank, and many others were clear and workable, but the fifteenth century lacked the advanced metals, the fuels, the lubricants, and the technical skills necessary to carry his brilliant ideas into practical reality. Many inventive ideas have had to wait until the supporting gaps in knowledge and technique were filled in. the recent "knowledge explosion" is often cited as the source of modern innovation. This is another way of saying that the cultural base is readily growing and is accessible to a growing portion of people

When all the supporting knowledge has been developed, the appearance of an invention or discovery becomes almost a certainty .In fact, it is quite common for an invention or discovery to be made independently by several persons at about the same time.

This is one reason new weapons systems are developed endlessly. It is in the nature of science and technology that anything we can build, any advanced people can build. And, so the rationale goes. Our enemies will build such weapons whether we do or not, so let's get on with it. Of course, this leads to can be limited only by international agreements which we seem unable to reach.

- **Cross-fertilization:** The great importance of the cultural base is revealed by the principle of cross-fertilization, which states that discoveries and inventions in one field became useful in an entirely different field. Pasteur's germ theory of disease grew out of his efforts to tell France's vintners why their wine turned sour. The vacuum tube, developed for radio, made possible the electronic computer, which now aids research in nearly everything from astronomy to zoology.
- **The exponential principle:** This principle states that, as the cultural base grows, it's possible uses tend to grow in a geometric ratio. To illustrate: if we have only two chemicals in laboratory, only one combination (A-B) is possible; with three chemicals, four combinations are possible (A-B-C, A-B, A-C, and B-C); with four chemicals, ten combination; with five chemicals, twenty-five ages grows by addition, the possible combinations of these elements grow by multiplication. This helps to explain today's high rate of discovery and invention. A vast accumulation of scientific technical knowledge is shared by all the civilized societies, and from this base new inventions and discoveries flow in a rising tide.

9. Resistance to and Acceptance of Social Change

Not all proposed innovations are accepted by the society. Some years ago, Spicer suggested that proposed changes meet resistance when (1) the change is imposed by others, (2) the change is not understood, or (3) the change is seen as a threat to people's values. A process of selective acceptance operates as some innovations are accepted instantly and some only after long delay; some are rejected entirely, and others are accepted in part. Acceptance of innovations is never total and is always selective according to several considerations.

i. Specific attitudes and values

Aside from its general attitude toward change, each society has many specific attitudes and values which cling to its objects and activities. When government agents introduced hybrid corn to the Spanish-American farmers of the Rio Grande Valley some years ago, the farmers readily adopted it because of its superior yield, but within three years, they had all returned to the old corn. They did not like the hybrid corn because it did not make good tortillas. People's established likes and dislikes are important factors in social change.

If an object has a purely utilitarian value that is, if it is valued because of what it will do- Change may be accepted quite readily. If some feature of the traditional culture is valued intrinsically - valued for itself, aside from what it will do - change is less readily accepted. To the American farmer, cattle are a source of income, to be bred, culled, and butchered whenever most profitable. But many of the Nilotic peoples of Africa, cattle represent intrinsic values. The owner recognizes and loves each cow. To slaughter one would be like killing one of the families. A Pakot with a hundred cattle is rich and respected; one with only a dozen is poor; one with no cattle is ignored as though dead. Efforts of Western officials to get such peoples to manage their herds "rationally"-to cull their herds, breed only the best, and stop overgrazing their lands - have generally failed.

ii. Compatibility with existing culture

Innovations are most readily accepted when they fit in nicely with the existing culture. Innovation may be incompatible with the existing culture in at least three ways.

First, the innovation may conflict with existing patterns. In many developing countries, the idea of appointment and promotion on a merit basis clashes with the traditional family obligation to take care of one's relatives. Many current environmental proposals in the United States conflict with our traditional concepts of land use, property rights, and personal liberties.

When an innovation conflicts with existing culture patterns, there are at least three possible outcomes: **(1)** It may be rejected; **(2)** it may be accepted, and the conflicting cultural traits may be modified to fit it; **(3)** it may be accepted and its conflict with the existing culture may be concealed and evaded by rationalization.

iii. Costs of change

The very poor generally resist all change, because they cannot afford to take any risk. Change is nearly always costly Not only does change disrupt the existing culture and destroy cherished sentiments and values, but it also involve some specific costs.

- **Technical difficulties of change:** Very few innovations can simply be added to the existing culture; most innovations require some modification of the existing culture. New inventions often make present machinery obsolete and destroy the market for skills which workers have spent years developing
- **Vested interests and change:** The costs of social change are never evenly distributed. The industry which is made obsolete and the workers whose skill is made unmarketable are forced to bear the costs of technical progress, while others enjoy the improved products. Those to whom the status quo is profitable are said to have a vested interest Communities with an army post or navy yard nearby find that all this government money is good for business, so these communities have a vested interest in retaining these multi-storey establishments.

Those with vested interests, however, appear as promoters of change whenever they believe the proposed change will be profitable to them. American corporations spend billions of dollars each year to develop new products which they can sell profitable.

iv. Role of the change agent

Who proposes a change, and how does this person go about it? The identity of the originator greatly affects acceptance or rejection.

Scanned with CamScanner

A Nigerian government effort to introduce, new fertilizer failed because of the peasants' bad past experiences with government officials. Any proposal identified as "communist" is doomed to certain defeat in the United States. Opponents of all sorts of proposals often label them communist in order to defeat them Innovations which are first adopted by persons at the top of the prestige scale and power system are likely to filter downward quiet rapidly; those first adopted by low-status persons are likely to percolate upward more slowly, if at all.

Change agents must know the culture in which they work. This point is stressed in the many guidebooks for aid officials working in development programs in underdeveloped countries, or even for change agents working to promote change in our own society.

The efforts of the change agent are not always appreciated. The inventor is often ridiculed; the missionary may be eaten; and the agitator or reformer is usually persecuted. Radicals are likely to be popular only after they are dead and organizations Change agents do not always observe all laws, but even careful law observance is no protection. It was impossible to be a labour organizer in the 1930s or a civil right worker in the 1950s without being beaten, jailed, or even worse.

Persecution of change agents and social reformers has a long history. Huss and Servants were burned at the stake, while Luther and Wycliffe narrowly escaped. Florence Nightingale fought against family opposition, public ridicule and scone, and official jealousy, intrigue, and slander in her efforts to change the image of nurse from slattern to professional. Change agents are likely to be honoured only when they are very old or very dead.

- **The deviant as change agent:** Many change agents are deviants of some sort. The nonconformist may unwittingly launch a new fashion, speech form, or any other form inventors are people who love to tinker; they are more excited by the challenge of a new idea than by the possibility of riches. Without deviants, there would be many fewer social changes.

CHAPTER 7

SOCIAL PROBLEMS

1. DEFINITION

Poplin describes it as: *"a pattern of behaviour that constitutes a threat to society or to those groups and institutions of which society is composed"*

Walsh and Furfey define it, *"a deviation from the social ideals remediable by group efforts."*

Weaver interprets it as *"a situation in a dynamic society believed to be a threat to or an infringement upon a social value and considered capable of amelioration or elimination by appropriate collective action."*

From the definitions it can be asserted that a social problem:

- Is a social situation in a society
- Is disliked by a large number of people
- Is violating a social value and its norms
- Is capable of elimination

2. GENERAL CAUSES OF SOCIAL PROBLEMS

- Poverty
- Social change
- Industrial development
- Cultural gap
- Complexity of life
- Social conflict
- Social disintegration
- Rural-urban migration
- Racial discrimination
- Orthodoxism
- Natural calamities

Scanned with CamScanner

3. CRIME

Definition: *"Crime is anti-social behaviour which a group rejects and to which it attaches penalties."*

All those activities for which the state lays down the punishment are crimes.

C.R. Darrow: *"An act forbidden by the law of land and for which penalty is prescribed is crime."*

Legal Definition: Violation of law constitutes crime

Elliott & Merrill: *"A crime implies a disturbance in a social relationship and a social definition as to what such disturbance is"*

4. THEORIES OF CRIME

Several theories are current as to why an individual commits a crime some of them are the following:

- **Theological school:** According to this theory, crimes increase when the religious tendency diminishes. It is not inevitable sometimes even religious people are seen committing the most heinous crimes.
- **Hedonistic school:** According to this, an individual indulges in criminal activity when he stands to gain more pleasure than to pain

  Cesare Beccaria, the protagonist of this school, maintained that crimes can be checked only when the pleasure attained by them is lesser than pain consequent of punishment. The followers of this school were against the punishment of children and insane because they have no judgment of pleasure and pain resulting from crime. Modern criminologists do not consider pleasure to be the sole motive of crime.
- **Geographical School:** Montesquieu, the author of Spirit of Laws says that crime rate increases near equator and decreases to Polar Regions. Adolf Quetlet has pointed out that in the hot countries one finds violent crime while in cold countries there are more crimes concerning property. According to this school, the causes of crime are geographical factors like climate, weather etc. Cohen has rightly pointed out that the conception of geographical school is more imaginative than factual.
- **Ecological school:** Ecological elements play the most important role in determination of crime. Clifford Shaw maintained that while one finds large number of juvenile delinquents in the centre of an urban area, their numbers goes on decreasing in the suburbs. Modern criminologists accept this fact
- **Typological school:** A criminal is a particular type of person. This type has been determined both on anthropological and psychological basis. Lombroso has maintained an intimate relation between physical structure and mental tendencies. The criminal is a particular type of person and have peculiar facial characteristics
- **The view of mental testators:** According to Goddard, nearly 25% criminals are feeble minded persons. Some mental testators consider feeble minded to be an important determinant of crime. Modern criminologists do not accept that all feeble minded are criminals.

- **Psychiatric view:** According to the psychoanalysts, the causes of crime are in the repressed desire, emotional imbalance and different types of mental diseases. For example, persons suffering from kleptomania have tendency to steal. It is not applicable to every criminal. This view gives no importance to social and economic causes of crime.
- **Socialistic view:** According to this, the main causes of crime are economic conditions and class struggle. It is a one sided view. It is not applicable to a large number of crimes.
- **Sociological view:** According to this view, the main determinant of crime is social endowment which determines the response of the criminal. Crimes are determined by social factors such as social mobility, cultural conflict, economic competition, social stratification, political, religious and economic aims and ideas, the density and quality of population, the distribution of weather etc.

Modern criminologists believe that the causes of crime are multiple and no single theory is sufficient to explain all the causes.

5. CAUSES OF CRIME

The main cams of crime are: (1) social (2) economic (3) physical (4) developmental (5) geographical (6) political

i. Social causes of crime

- **Broken Family:** It is dominant factor in social causes of crime. Now a days:

  (i). Family disorganization can be seen. (ii). Lack of control over individuals. (iii). Members have individual paths. (iv). No restrictions on criminal tendency of children .(v). Children are devoid of love (iv). No respect for elders lead to carefree, unrestricted individual life. (vii). One main cause of adultery, abortions, miscarriage, prostitutions and juvenile delinquency is the undesirable domestic conditions.

  Dr. Charles Goring has proved that it is not possible to establish any marked distinction between the physical characteristics of the criminal and those of normal persons. According to modern criminologists, criminal tendencies are not innate but acquired. Typological school has only historical significance.
- **Absence of social control:** Previously, the caste ***panchayats*** in the villages kept control over the behaviour and conduct of the members of the caste. Caste ***panchayats*** announced very stern punishment. This tended to control and check crime effectively.

  Secondly, with better facilities of transport being available the criminal can commit the crime and abscond from the village to the town. Criminals enter in the city mob and cannot be traced.
- **Defective education:** Modern education dos not develop the character of the student in right direction. Late employment leads to late marriage. All these causes tend to aggravate criminal activity.
- **Cinema:** According Blumenand Hansen Cinemas indirectly influence the male criminal. These teach crime techniques by exhibiting many kinds of crime, by stimulating the desire of wealth and comfort, by showing ways and means of appropriating them illegally. These set alight the sexual desire, the desire of love making, independence and variety.

Scanned with CamScanner

- **Newspapers** increase criminal activity by publishing method of crime. They highlight the causes which tend to increase.
- **Use of Alcoholism:** Drinking is more prevalent among those who have a low standard of living
- **Defects of marriage and Dowry system:**
  1. Dowry system urges the fathers of girls to earn money through illegitimate means for their daughter's marriage.
  2. It leads to suicide by many young girls.
  3. It encourages late marriages.
  4. Very often parents do not care to ask the girl or boy for opinion and sometimes even proceed against it. This results in suicide and other crimes.
- **Religion:** This does not mean that religion itself encourages crime but the encouragement has come from different sects which originated in the difference of opinion. Communal riots and crimes like looting, murder etc perparted in order to increase the followers of one's own religion and to injure another religion. In 1947 partition, people were whipped, breasts were cut off. Their children's hearts were cut out in front of their eyes.
- **Changes in social values:** Now-a-days, new notions like materialism, individualism, rationalism, the respect for wealth, absence of sex restrictions etc. are becoming very popular in the country.

ii. Economic causes

- **Poverty:** To appease one's hunger, one involves in criminal activity. Dr. Haiker Wal has investigated that during the period 1917-27 thefts increased in number. When the prices of wheat went up, and decreased when the prices of wheat fell. Poor girls are easily extracted by men who violate them, take away their virginity and put them on the market.
- **Unemployment:** Many young men commit suicide when they are frustrated by extreme poverty and continuous unemployment. Many others turn to thieving, pick pocketing, robbery, violence, gangsterism etc.
- **Industrialization:** It has destroyed the family life of labourers. They have to work hard for eight to ten hours. They have to live in towns far away from their families. Families live in a house having no more than one room. In such conditions the married women have no privacy and children and unmarried members witness happenings which they should not see. They involve in sex crimes. Many girls from rural areas are deceived with the promises of employment and brought to towns where they are forced to adopt prostitution.
- **Urbanization:** In towns there are opportunities for pick pocketing and practicing deception in a crowd. Cinemas, gambling dens, indecent theatres and wine shops provide means of superior recreation. This encourages crime.

6. REMEDIES

1. **Consolidation and landholdings:** Fix minimum limit for landholdings and no further subdivision and fragmentation should be allowed.
2. **Education:** Better citizen in comparison to an illiterate and an ignorant person
3. **Higher living standard of masses:** Cottage industries should be increased.

4. Play and recreational facilities.
5. Parole and probation Successful in Pakistan
6. Strict censorship of literature and films
7. **Revival of religious values.** Religious education in school and colleges to acquaint the coming generations with true spirit of Islam
8. Technical training of the prisoners.
9. Separate court and jails for juvenile
10. Public cooperation should be encouraged.
11. Parents and teachers should be trained in child psychology.
12. ***Islahi*** (welfare) committees.
13. **Insurance and social security arrangements** against unemployment, old age or other mishaps may cause a decrease in the rate of crimes in a society.
14. **Youth organizations and associations**. Youth hostels should be established to provide every type of facility to youth on concessional rates

Scanned with CamScanner

CHAPTER 8

CHILD LABOUR IN PAKISTAN

1. INTRODUCTION

The extent of child labour can be gauged from the fact that there are about two million Pakistani children under seven who are forced to earn a living in conditions which will be unbearable even for adults. Although the Constitution specifically prohibits children under 14 years from being employed in a factory or mine or engaged in any other hazardous occupation, about 3% of the children between 10 and 14 years form part of the workforce in Pakistan.

Currently, the number of child labourers in the age group of 5-14 years in Pakistan is estimated at 3.3 million, according to a survey conducted by the Federal Bureau of Statistics in collaboration with the ILO, although the Human Rights Commission of Pakistan puts this figure around 12 million. Quoting the figures from the survey, the officials said: out of 3.3 million children, 2.4 million or 73% were boys and the remaining 27% were girls. The survey revealed that about 71% of the employed children worked in elementary or unskilled occupations in the field of agriculture, sales and services, manufacturing and transport sector, and 19% were involved in craft and other related activities.

2. CAUSES OF CHILD LABOUR IN PAKISTAN

Many explain child labour as a consequence of poverty in our rural areas, where 68% of our population lives. This poverty is accentuated by the unequal distribution of land which causes inability in most rural families to secure even subsistence level. When these landless families migrate to urban areas, their conditions often remain severe and children are thus enlisted to extend a helping hand to the family income. Yet this explanation needs to be supplemented by the realization that poverty is not only the cause but is also a result of child labour. It is a succession of events and situations that are interlinked. Also, the fact that many areas of the country are without schools convinces parents to send their children to work so that they can learn some skill which will prove useful for them when they grow up.

The absence of a social security system also requires the bread-winner of the family to depend on children to bring in an extra-income for subsistence. Another reason is that the children cannot form trade unions, the children cannot go to the court of law, they cannot go on strikes fighting for their rights; they are most vulnerable - they are the cheaper source of labour and that is why they are employed and their parents are left jobless.

What is more significant is that there are absolutely no rules or laws affecting a vast majority of children working in the unorganized sectors of agriculture and domestic work, etc. The situation calls for a progressive application of the appropriate labour laws. It would be more plausible to work for strengthening of the inspection and reporting systems along with efforts to eradicate corruption in the enforcement machinery. In this way, it can at least be ensured that children are not employed in hazardous occupations.

3. ELIMINATION OF CHILD LABOUR

To eliminate child labour, the government should not only set up an efficient monitoring system but also create circumstances for society so that families do not have to depend on child labour for their survival. This means creating better economic opportunities, improving educational facilities and, more important, giving the poorer sections of society some form of economic or welfare cushion whereby they do not have to fall back on their children for their economic survival. With improved monitoring system together with pressure from the media, and local and international organizations for the protection of children can serve at least to improve the lot of the working child, if not to ensure the total eradication of the bane of child labour. Also, some form of incentives must be offered to industries that offer a healthy working environment and that organize literacy classes or vocational training for their child workers besides rendering monetary assistance to their families. The good news is that perceptions are changing albeit slowly. However, the authorities must realize that child labour is a very real issue that has far-reaching implications for the future of the nation as a whole.

4. NEW ILO CONVENTION ON WORST FORMS OF CHILD LABOUR

On June 17, 1999, the International Labour Assembly unanimously adopted the Convention on the Worst Forms of Child Labour. The Convention applies to all children under the age of 18 and calls for "immediate and effective measures to secure the prohibition of the worst forms of child labour as a matter of urgency." In addition, it recommends to the ratifying states to declare exploitation of children a criminal offence and imposes sanctions on perpetrators.

Article 6 of the Convention stresses the need for designing programmes of action through a process of consulting with government institutions, employers, the children directly affected by the worst forms, their families, and other concerned groups. At long last the government has entered into agreements with the EC and the ILO to tackle the problem of child labour. Among other things, it has set up some rehabilitation centres for under-age children working in various factories. However, it has a long way to go in eradicating the menace and providing children and their families with viable alternatives.

i. Child labour elimination project, Sialkot

The solution to this dilemma lies in a series of measures meant to gradually eradicate child labour while not overlooking the plight of families which need their young ones to work to earn for sheer subsistence. Equally vital is the need to avoid a serious decline in the level of industrial production. Difficult as this strategy may seem, it has already been accomplished with a considerable degree of success by the Child Labour Elimination Project, Sialkot, whereby the majority of the young workers in the soccer ball stitching industry have been put out of the regular work-force. Instead their families have been given micro-credit as compensation, besides

Scanned with CamScanner

other benefits. Also, in addition to the children's female relatives already working in the industry, more women have been employed to fill the gap in productivity left by the laid-off child labourers. Also, a rehabilitation programme that includes educational benefits for the young workers who have been relieved of work has been instituted.

Keeping this example in mind, it would be a good idea for trade unions and employers all over the country to institute similar programmes. Even where child labour cannot be altogether eliminated, working conditions can certainly be made better for the young workers along with facilities for free education for them outside after working hours. Moreover, the government must provide incentives to employers, perhaps in the form of tax concessions, and in return expect them to institute classes for literacy and vocational training for their young workers.

ii. Rehabilitating carpet children

The carpet industry is set to rehabilitate over the next three years about 25,000 children engaged in carpet-weaving. Informal education is already being imparted at 60 education centres and another 370 such centres are to be established in the next two years. Two projects have been simultaneously undertaken for rehabilitating carpet children by ILO, Pakistan Carpet Manufacturers and Exporters Association (PCMEA) and Canadian International Development Agency (CIDA) through NGOs, mainly through Child Care Foundation (CCF).

A 300-school project, funded by the USA, Pakistan and PCMEA, has now been started to free the sector of child labour. Thirty schools are already functioning and the remaining 270 centres would be set up in the next few months. They would take care of more than 10,000 carpet children. Another 30 schools run by CCF are already training and educating about 1,000 children. In the next two years, CCF is to start 100 more schools with support from CIDA to take care of about 5,000 children. Nearly 20,000 carpet children would thus be rehabilitated over the next two years.

In these schools, children are given informal education which prepares them for formal education. They are also trained in technical fields to prepare them for practical life and ensure that they would be eligible for employment on the strength of their skills. No fee is charged from students and the teachers are paid by CCF. Timings are flexible to enable children to attend school in their free time.

iii. National action plan for the elimination of child labour

With the Cabinet's approval of the National Policy and Plan of Action for the Elimination of Child Labour, the government will hopefully forge ahead in its attempt to rehabilitate young labourers and prevent the entry of more into the workforce. The policy envisages progressive elimination of child labour from all economic sectors; withdrawal of children from the worst forms of child labour; prevention of under-age children into labour market through universalisation of primary education; family empowerment; rehabilitation of working children through non-formal education; pre-vocational training, and skill development and enforcement of child labour laws.

The NAP is based on an integrated approach and would be implemented at the federal, provincial and district levels. The plan aimed at reaching the target children through various short- and long-term strategies.

The short-term strategies include awareness raising, development and dissemination of information, community mobilization, establishment of monitoring and evaluation system, withdrawal of children from exploitative labour on priority basis, and special protection to the most vulnerable groups of child labour.

The long-term strategies include universalisation of primary education, full implementation of protective laws, empowerment of families, poverty alleviation, expansion of social safety nets etc. Education and skill development of working children, institutional capacity building and strengthening of inspection services are among some of the medium-term strategies.

According to the scheme, the existing infrastructure would be utilized in coordination with Allama Iqbal Open University, mainstream education schools, vocational training centres etc. for this plan, to be introduced as a part of five-year plan to serve as a large-scale institution networking for the country-wide elimination of child labour from the industrial sector.

In the implementation of the plan, the ministries of labour, education, law, justice & human rights, information and media development, social welfare and health have to play their roles to achieve the objectives.

In sum, Pakistan is now one of the few countries left in the world that have so far not made primary education compulsory. Child labour cannot be eliminated without providing educational facilities to all and sundry. Poverty coupled with illiteracy is mainly responsible for a low completion rate (48%) and as high dropout rate (50%). Child labour obviously cannot be eradicated under such compelling economic circumstances. Inequality in the society has actually accentuated this problem.

Pakistan is a signatory to the UN Convention on the Rights of the Child, and under this, as well as under other international agreements; it is morally obliged to bring its laws into conformity with the guiding principles of child rights.

In any case, it cannot afford to regress as happened last year when the Lahore High Court struck down the Juvenile Justice System Ordinance (the Supreme Court suspended the judgment sending further orders). But more than that, our politicians and bureaucrats need to activate public consciousness about the state of our children. As a society, we attach little importance to the mental and physical well-being of the children, often subjecting them to harsh punishment in schools, and turning a blind eye to other ills such as child prostitution and trafficking.

5. National Child Policy

The Government is intended to remove the structural causes related to all issues affecting children's rights in the wider societal context and to awaken the conscience of the community to protect children from violation of their rights, while strengthening the family, society and the Nation.

i. Right to survival

- Every child has a right to survival. The State and community will undertake all possible measures to ensure that the child's right to survival is protected and realized.
- In particular, the State and community will undertake all appropriate measures to address the problems of infanticide and feticide, especially of female child and all other emerging manifestations which deprive the girl child of her right to survival.

Scanned with CamScanner

ii. Right to health

- The State shall take measures to ensure that all children enjoy the highest attainable standard of health, and provide for preventive and curative facilities at all levels especially immunization and prevention of micronutrient deficiencies for all children,
- The State shall take measures to cover, under primary health facilities and specialized care and treatment, all children of families below the poverty line.
- The State shall take measures to provide adequate pre-natal and post-natal care for mothers along with immunization against preventable diseases.
- The State shall undertake measures to provide for a national plan that will ensure that the mental health of all children is protected.
- The State shall take steps to ensure protection of children from all practices that are likely to harm the child's physical and mental health.

iii. Right to nutrition

The State shall take steps to provide all children from families below the poverty line with adequate supplementary nutrition and undertake adequate measures for ensuring environmental sanitation and hygiene.

iv. Right to a standard of living

- The State recognizes every child's right to a standard of living that fosters full development of the child's faculties.
- In order to ensure this, the State shall in partnership with community prepare a social security policy for children, especially for abandoned children and street children.
- State and community shall try and remove the fundamental causes responsible for abandoning children and children living on streets, and provide infrastructural and material support by way of shelter, education, nutrition and recreation.

v. Right to play and leisure

The State and community should recognize the right of all children to play and leisure and ensure means to provide for recreational facilities and service for children of all ages and social groups.

vi. Right to early childhood care

- The State shall in partnership with community provide early childhood care for all children and encourage programmes which will stimulate and develop their physical and cognitive capacities.
- The State shall in partnership with community aim at providing a child care centre in every village where infants and children of working mothers can be adequately cared for.
- The State will make special efforts to provide these facilities to children from SCs/STs and marginalized sections of society.

vii. Right to education

- The State recognizes the right to elementary education of all the children. Education at the elementary education shall be provided free of cost and special incentives should be provided to ensure that children from disadvantaged social groups are enrolled retained and participate in schooling.

- At the secondary level, the State shall provide access to education for all and provide supportive facilities from the disadvantaged groups.
- The State shall in partnership with community ensure that all the educational institutions function efficiently and are able to reach universal enrolment, universal retention, universal participation and universal achievement.
- The State and community recognizes the right of all children to education in their mother tongue.
- The State shall ensure that education is child-oriented and meaningful. It shall also take appropriate measures to ensure that the education is sensitive to the rights of the girl child and to children of various cultural backgrounds.
- The State shall ensure that school discipline and matters related thereto do not result in physical, mental, psychological harm or trauma to the child.
- The State shall formulate special programmes to spot, identify, encourage and assist the gifted children for their development in the field of their excellence.
- The State shall ensure comprehensive religious teachings to each child to make him responsible citizen of the country with good moral values and character building.

viii. Right to be protected from economic exploitation

- The State shall provide protection to children from economic exploitation and from performing tasks that are hazardous to their well-being.
- The State shall ensure that there is appropriate regulation of conditions of work in occupations and processes where children perform work of a non-hazardous nature and that the rights of the child are protected.
- The State shall move towards a total ban of all forms of child labour.

ix. Right to protection

- All children have a right to be protected against neglect, maltreatment, injury, trafficking, sexual and physical abuse of all kinds, corporal punishment, torture, exploitation, violence and degrading treatment.
- The State shall take legal action against those committing such violations against children even if they are legal guardians of such children.
- The State shall in partnership with community set up mechanisms for identification, reporting, referral, investigation and follow-up of such acts, while respecting the dignity and privacy of the child.

x. Protection in distress

- The State shall take strict measures to ensure that children are not used in the conduct of any illegal activity, namely, trafficking of narcotic drugs and psychotropic substances, begging, prostitution, pornography or armed conflicts. The State in partnership with community shall ensure that such children are rescued and immediately place under appropriate care and protection.

Scanned with CamScanner

- The State and community shall ensure protection of children in distress for their welfare and all-round development.
- The State and community shall ensure protection of children during the occurrence of natural calamities in their best interest.

xi. Right to protection of the girl child

- The State and community shall ensure that offences committed against the girl child, including child marriage, forcing girls into prostitution and trafficking are speedily abolished
- The State shall in partnership with community undertake measures, including social, educational and legal, to ensure that there is greater respect for the girl child in the family and society.
- The State shall take serious measures to ensure that the practice of child marriage is speedily abolished.

xii. Right of adolescents to education and skill development

The State and community shall take all steps to provide the necessary education and skills to adolescent children so as to equip them to become economically productive citizens, special programmes will be undertaken to improve the health and nutritional status of the adolescent girl.

xiii. Right to equality

The State and community shall ensure that all children are treated equally without discrimination on grounds of the child's or the child's parents' or legal guardian's race, colour, caste, sex, language, religion, political or other opinion, national, ethnic or social origin, disability, birth, political status, or any other consideration.

xiv. Right to life and liberty, name and nationality

Every child has a right to life, liberty, a name and to acquire a nationality.

xv. Right to freedom of expression

All children shall be given every opportunity for all round development of their personality, including creativity of expression.

xvi. Right to freedom to seek and receive information

- Every child shall have the freedom to seek and receive information and ideas. The State and community shall provide opportunities for the child to access information that will contribute to the child's development.
- The State and community shall undertake special measures to ensure that the linguistic needs of children are taken care of and encourage the production and dissemination of child-friendly information and material in various forms.
- The State and community shall be responsible for formulating guidelines for the mass media in order to ensure that children are protected from material injurious to their well-being.

xvii. Right to freedom of association and peaceful assembly

All children enjoy freedom of association and peaceful assembly, subject to reasonable restrictions and in conformity with social and family values.

xviii. Right to a family

- In case of separation of children from their families, the State shall ensure that priority is given to re-unifying the child with the parents. In cases where the State perceives adverse impact of such a reunification, the State shall make alternate arrangements immediately, keeping in mind the best interests and the views of the child.
- All children have a right to maintain contact with their families, even when they are within the custody of the State for various reasons.
- The State shall undertake measures to ensure that children without families are either placed for adoption, preferably intra-country adoption, or foster care or any other family substitute services.
- The State shall ensure that appropriate rules with respect to the implementation of such services are drafted in a manner that are in the best interest of the child and that regulatory bodies are set up to ensure the strict enforcement of these rules.
- All children shaft" have the right to meet their parents and other family members who may be in custody.

xix. Responsibilities of the parents

The State recognizes the common responsibilities of both parents in rearing the children.

xx. Rights of refugee children

The State shall ensure that all refugee children, with or without parents, receive due care and protection.

xxi. Rights of children with disabilities

- The State and community recognize that all children with disabilities have a right to lead a full life with dignity and respect. All measures would be undertaken to ensure that children with disabilities are encouraged to be integrated into the mainstream society and actively participate in all walks of life.
- State and community shall also provide for their education, training, health care, rehabilitation, recreation in a manner that will contribute to their overall growth and development.
- State and community shall launch preventive programmes against disabilities and early detection of disabilities so as to ensure that the families with disabled children receive adequate support and assistance in bringing up their children.
- The State shall encourage research and development in the field of prevention, treatment and rehabilitation of various forms of disabilities.

xxii. Rights of children from marginalized and disadvantaged communities

The State and community shall respect the rights of children from all marginalized and disadvantaged communities, to preserve their identity, and will encourage them to adopt practices that promote the best interest of children in their communities.

Scanned with CamScanner

xxiii. Special intervention & support

The State recognizes that children from disadvantaged communities, especially from the Scheduled Castes and Tribes, and are in need of special intervention and support in all matters pertaining to education, health, recreation and supportive services. It shall make adequate provisions for providing such groups with special attention in all its policies and programmes.

xxiv. Rights of child victims

The State shall in partnership with community draw up plans for the identification and rehabilitation of child victims and ensure that they are able to recover, physically, socially and psychologically, and re-integrate into society.

xxv. Right to child friendly procedures

All matters and procedures relating to children, viz. judicial, administrative, educational or social, should be child friendly. All procedures laid down under the juvenile justice system for children in conflict with law and for children in need of special care and protection should also be child-friendly.

It is hoped that the GOP will use all its available resources for implementing the above mentioned child policy in letter and spirit.

CHAPTER 9

BONDED LABOUR IN PAKISTAN

1. INTRODUCTION

In ancient societies people were forced to work for elites from generation to generation on two time meal negating and abusing their human rights as there was no concept of human rights in the primitive societies, where Riggs F.W. states that having passed from transitional periods i.e. fused to prismatic and now diffracted, influential and powerful are practicing the same. Forcible slavery still exists even after the emergence of the civil society. Bonded labour is one of the issues of the present societies where people are working against their will, in most of the cases for the life-time.

In countries where it exists, bonded labours are deprived of their basic rights, i.e. education, health and shelter etc.. They are dependent on their masters for their livelihood. In recent decades, all most all the advanced counties, financial institutions and NGOs are focusing on the elimination of this menace as per UN human rights charter. In Pakistan, it exists in brick kiln, rural areas of Sind and some parts of NWFP in the form of peasantry and in the red light areas besides in many industrial units in the form of child labour. Recently government was forced to frame laws to prevent the bonded labour. Research is underway in many areas to explore deep into the different avenues of the problem and eliminate it through different measures.

2. PROBLEM STATEMENT

Despite many steps taken by government and NGOs to solve the problem of bonded labour in Pakistan, still it is a serious question. Pakistani law define bonded labour as "a ***peshgi*** advance received by him or any member of his family, a person by himself or through any member of his family renders labour or service either without wages or for nominal wages or forfeits freedom of employment with another person for a specified or non-specified period or forfeits the right to freely move from one place to another or forfeit the right to appropriate or sell at the market price his property and includes a surety who agrees to render bonded service on the failure of the debtor and on his behalf" The actual figure of bonded labour in Pakistan and the inhuman treatment by their masters is still behind the scene. In a country where the exact statistics is not known one cannot expect the solution of the problem. What government, NGOs etc. are doing the most is the release of some bonded labours but this is a partial solution. Until the root cause "poverty" is not eliminated, bonded labours will remain bonded. This research is thus, an effort to:

Scanned with CamScanner

"Identify the prevailing situation of bonded labour, the government half-hearted efforts, and the critical issues responsible for failure of government, and to pin point those conditions, which are operating as the breeding grounds and to get understanding about the possible solution trajectory".

According to ILO report 1993, 20 million bonded labourers exist in Pakistan but they do not exist in official records and they even do not have the right to vote due to the provision of section 7 of the electoral rules 1974 that deny bonded labourers and nomads the right to vote. The Bonded Labour Liberation Front of Pakistan began its campaign to free the bonded brick kiln labourers and totally abolish their ***peshgi*** debts. The BLLF freedom movement faces challenges and opposition from employers. Employers and government collude to confuse and distort the picture, and deny the very existence of bonded labour in Pakistan. Throughout Pakistan employers forcibly extract labour from adults and children, restrict their freedom of movement, and deny them the right to negotiate the terms of their employment. Employers coerce such workers into servitude through physical abuse, forced confinement, and debt-bondage. The government of Pakistan is complicit in these abuses, both by the direct involvement of the police and through the state's failure to protect the rights of bonded labours because it rarely prosecutes or punishes employers who hold workers in servitude, and workers who contest their exploitation are often imprisoned under false charges. Pakistan's Supreme Court declared bonded labour to be unconstitutional and took the first step to abolish it. National Assembly passed a law formally abolishing bonded labour and prohibiting the practice. Bonded labour, or "debt bondage" as it is labelled at international level, is a practice condemned by the United Nations as "similar to slavery" and consequently a violation of Article 4 of the Universal Declaration of Human Rights. It is considered by the ILO to constitute forced labour and to be a violation of the ILO's Convention No. 29 on Forced Labour. In the days and months after the Supreme Court's judgment of 1989, tens of thousands of bonded labourers in Pakistan's brick kilns left the jobs that they had been doing as a result of the pressure of debt bondage, especially in the rural Sind the bonded labourers were released but after sometimes due to economic constraints they returned to their old masters because there was no option to meet their requirements and to rehabilitate. However, BLLF concluded that, despite temporary progress following the Supreme Court's judgment, debt bondage remains both widespread and virtually unchallenged by the Government of Pakistan. Indeed, it is both remarkable and tragic how little government officials have been willing to do to enforce the country's laws and to bring an end to debt bondage.

In many cases, it is entire families that are bonded in Pakistan. Of course, there are specific cases of children being pledged or bonded in return for loans to their parents, notably in the carpet industry, agriculture and prostitution. The way the children are absorbed and obliged to work varies, but as a matter of routine the children of bonded families do not attend school, but start helping their parents work as soon as they reach school age, if not before. There have been various attempts to estimate the number of bonded labours in Pakistan, involving the ILO, but no statistics have been published concerning the number of children, or the total number of people in Pakistan, who are victims of debt bondage. Following are the areas where severe bonded labour exists and need to be eradicated.

Brick Kilns in Punjab: In the brick kilns of Punjab, in which bonded labourers were the particular focus of the Supreme Court's 1989 judgment, workers continue to be bonded by debt as a matter of routine, even though conditions of work have in many cases improved and there are fewer

reports of the physical abuse of bonded labourers than in the past. Over the past year there have been a series of court cases in which the courts have ordered the release of bonded brick kiln workers.

Agriculture in Sindh and KPK: In the agricultural sector, in contrast, bonded labour remains under reported and largely unreformed and the subject of virtually no releases ordered by the courts. In the rich irrigated estates east of Hyderabad in Sind in southeast Pakistan, there are estimates that between 50,000 and 60,000 agricultural workers are in debt bondage. Virtually all of these bonded labourers working on farms in Sanghar, Mirpur khas and Umer kot Districts are from the indigenous Pakri community, which has its origins in the desert areas of southeast Sind. Their bondage usually has its origins in a sharecropping arrangement, but degenerates to debt bondage as the Pakri have to resort to loans to pay for seeds, fertilizer and other requirements before their first harvest.

In NWFP, the condition of bonded labour in the field of agriculture is not different from that of the Sindh. Distt. Swabi, a rich agricultural area has very old peasantry culture of bonded labour where land owners in favour of loans obtained by their peasants bound them to work for them until the return of their loans. In majority cases peasants are unable to repay due to ever increasing production cost, resultantly they become bonded.

Prostitution in Pakistan: In the 21st century, where freedom and democracy are spreading to every continent, it is appalling and morally unacceptable that hundreds of thousands of men, women, and children are exploited, abused, and enslaved by paddlers in human misery. Human trafficking specially kidnapping, purchase and sale particularly of the young girls and women either willingly by their parents or groups to the red light areas to forcibly adopt the prostitution as their profession is the worst form of forced and bonded labour in Pakistan. Human trafficking touches many countries across the globe. An estimated 800,000 million to 900,000 million people trafficked every year. Approximately 30,000 women are trafficked from Asia to USA for the purpose of prostitution. According to a survey, 60000 women are working in Pakistan in this field and each woman every weak served from 5 to 50 people for sexual intercourse.

The trafficking of women and girls into prostitution is a global phenomenon. Despite laws against slavery and bonded labour in almost every country, young people continue to be sold into or exploited by the sex industry, one of the most profitable industries in the world. Modern forms of slavery include indentured servants, person held in hereditary bondage, child slaves who pick plantation crops, child soldiers and adults and children trafficked and sold into sex industry. Red light areas in Pakistan, especially in Lahore (***ShahiMohalla***), Bazar-e-Hussans of Multan, Rahim Yar Khan, Kasur, Layyah and Hyderabad are governed by strict rules and guarded by ***gundaism***. Middlemen are the source of the input that made possible the women trafficking from the Russia, Ukraine, Central Asian Republic States, Iran, Afghanistan, Bangladesh, Sri Lanka, and Philippines and within the country. Once girl/women enter to the red light areas, she can never escape for the whole of her life working against her will. These unfortunate women and their kith and kins are the parcel part of these brothels working from generation to generation even they do not know their past and families and where from they were kidnapped in the childhood? Influential bureaucrats, politicians, feudal lords, smugglers, underworld people and police are backing this profession. In Pakistan, red light areas are the nursery to film industry, however, once a girl becomes the part of this profession, she will have to serve for the whole of her life and

Scanned with CamScanner

cannot change or leave her profession, if some made it possible, the guardians of the business with the help of influential personalities bring them back or captured them and sold them to other professional because they are considered as precious properties and the major sources of earning.

3. ERADICATION OF THE MENACE

In principles' government of Pakistan paid attention to the problem after serious campaign by human rights activists. The bonded labour prevention act, abolition rules of child labour especially in the export related industry, free schooling, the Supreme Court of Pakistan decision and action taken by the lower courts, to implement the higher courts decision are the positive signs, however, the district administration and police who are the direct implementing agencies paid poor attention to this human problem. Present government of the country introduced the political, administrative and police reforms by empowering the labour class and women participation in government at every level, appreciated and welcomed by the international community and human rights organizations and civic society. Keeping in view the seriousness of the problem, government and CBOs can take the following measures:

4. MEASURES BY GOVERNMENT

Government is certainly responsible for the equal distribution of economic resources and balanced development to facilitate all citizens without discrimination with access of its entire citizens to the justice, because the only cohesive bond for the people having multicultural, bilingual and different geographical locations is the sense of justice and equality by the government. Modern welfare state and specially Pakistan, which was created on the Islamic slogan, is required to fulfil her commitments. Father of the nation in his many speeches highlighted the purpose of the creation of Pakistan. He was of the view that in Pakistan all the citizens will be equal in the eyes of justice.

Major problems faced by the released bonded labourers are that of injustice and inequality and rehabilitation. How can we think that without solving the economic problems of the bonded labour only their release will solve their problems? Government and society is required to play due role to eradicate this menace, following are the suggestions:

Rehabilitation through economic measures

Carl Marks says 'man moves on belly' where Maslow's opines that there is a hierarchy of human needs, the first deficiency to be satisfied is that of the biological and physiological needs i.e. hunger, thirst, and sex, basic problem of a man is to feed himself then comes the security, social, and esteem and self-actualization needs. Fulfilment of theses can make a person loyal with the state and make him a responsible citizen. F.W. Taylor argues that man can be motivated through satisfaction of economic needs. Keeping in view this in mind, following measures are suggested to reduce the intensity of the problem:

Entrepreneurship schemes are to be launched for the released bonded labourers in order to stand on their own feet and never look back to their ex-masters for economic relief. Provision of loans without interest or from the Zakat fund for the establishment of small businesses, like fruit and vegetables shops, tea canteens and other such like businesses can also play a great role to overcome the problem. The establishment of SME in June 1st 2002 for assistance in business, and Khushali Bank can play significant role to solve the problem of bonded labour through micro credit and micro financing.

Technical and vocational training, programs and courses for skills development in order to polish their skills in the technical and mechanical fields and then their adjustment through overseas employment is need of the day which can play a significant role in rehabilitation of the bonded labourer on one hand and earning handsome foreign exchange on the other.

Housing schemes is another step which will help the government to rehabilitate and rid the bonded labourer from the clutches of their masters because in many cases it has been witnessed that due to non-availability of shelter (house), unwillingly bonded labourers returned to their masters because they can provide the shelter. Government should launch a housing program in the areas where the problem is severe. Pakistan Poverty Alleviation Fund (PPAF) setup in April 2000 can play effective role in solving the problem.

Placement of one of the family member in the public sector jobs or allocating special quota like the disables, to adjust one person from each family for their livelihood can also help in reduction of their miserable plight. Government can also with the help or by the strict rules and regulations through labour and industrial policy can bound the industrialists to adjust the released bonded labourer referred by the governmental agency or either by the NGOs working for their release and rehabilitation and keep strict watch over the industrialist whether they observe the government regulations or not.

Distribution of government owned uncultivated land among these ill-fated people for agriculture purpose can also help solve their economic problems. It will have the dual benefits one, the rehabilitation of the bonded labourers, second increase in agricultural production will contribute to the corporate economic infrastructure of the country.

Implementation of Policies and ensuring the rule of law

Provision of justice and creating sense of security by district administration, police and judiciary, the functionaries of government at local level by strictly implementing the law and policy of the government especially the labour department can play a pivotal role in this connection. The local police with the help of community organizations can easily ensure relief and security. It has been observed that in many cases actually, it is the failure of the local authorities that they are unable or incapable to implement the law due to influential elites of the area. Welfare states do justice equally and all the citizens are equal in the eyes of the justice.

Abolition of the Feudalism

The biggest problem hampering the socioeconomic development in the developing nations is their rigid feudal system. Each landlord owe thousands of acres of agricultural land from generations to generations and the people working on their lands as peasants and cultivators are bound to work for generation to generation hence there is no chance to change their lives and to increase their living standard. There is no education, health facilities; in some areas the feudal intentionally disallow the educational and health services just to suppress their peasants. Peasantry is the nastiest form of forced n the developing countries. In past some land reforms were introduced to abolish the feudal system but the feudal structure is so powerful that eventually the decision was taken back before bearing the fruits. No government is ready to abolish the feudal system as feudalism has roots in political, military and civil bureaucracy of Pakistan. Economists suggest land reforms for maximum productivity; experiences shows that land reforms introduced in developing nations helped them strengthen their economies. Abolition

Scanned with CamScanner

of feudal system particularly in Sind and Punjab will bring a greater change in ridding the menace of bonded labour as well as it will boost the agriculture sector hence strengthen the Pakistan's economy as well.

Contributions from the Society

Community participation and development through education and awareness regarding their rights and removing the fear of police, and political elite's inter alia the fear of economic threats can also be very helpful to solve the problems of bonded labour in Pakistan. CBOs, NGOs, Religious and other social welfare organizations are able to raise voices, arrange walks, celebrate special days, conduct debates, seminars, group discussions and use the electronic and print media to get the attention of the rulers, civil servants and general masses for favour and support of eradicating the menace of bonded labour. Furthermore, they can make plans how to rehabilitate by establishing small villages with cottage industry to solve the economic and housing problems of bonded labour. In the big cities in cases of bonded prostitutes, NGOs can build special homes (Dar-ul-Ammans) along with technical and vocational education centres and industrial homes to help them out of the doldrums of the bonded prostitution.

5. Conclusion

Bonded labour networks enslave thousands of men; women and children each year are among egregious systems of human-rights violations in the world. In Pakistan, the role of government in eliminating the bonded labour is very meagre. Research indicate that some measures are taken by the government but they are meaningless because the implementing agencies of the government are either weak or they have their own interests that is why the government policies and law are not implemented in letter and spirit. The proposed solutions, however, are distinctly different in their approaches and outcomes. They ranges from formulation and implementation of rules and regulations, to providing services that attempt to reduce the harm done to them and to liberating the victims and abolishing the systems of bonded slavery entirely up to their economic help and rehabilitation. Around the world and particularly in Pakistan, government and NGOs must join hands in the campaign to eradicate bonded labour, working together to thwart criminal persons and organizations that seek profit from enslavement. Whether in courts, media, or in integrated local campaigns, law enforcement officers and human rights activists must find ways to rescue victims from indentured, forced prostitution and child labour. At the same time, organizations and government should conduct broad educational campaigns to prevent other innocents from falling prey to this 21st century form of slavery.

CHAPTER 10

ENVIRONMENTAL ABUSE IN PAKISTAN

1. Introduction

The term environmental abuse refers to several varied types of human activities, from contaminating the air to depleting irreplaceable resources. Environmental abuse occurs as human beings violate basic principles of ecology. Polluting the air and water, spreading radio-activity into the atmosphere, increasing levels of noise, creating numerous wastes, and consuming irreplaceable resources — all affect the global eco-system. Since human beings are part of the eco-system, we too are affected by these activities.

2. Nature of Environmental Abuse

There are six major types of environmental abuse: municipal and solid waste, air pollution, degradation of farm land and grazing areas, deforestation, and destruction of mangroves forests.

As for air pollution, caused in large part by massive increase in vehicular traffic, the Traffic Police and the Environmental Protection Departments (EPDs) of all Provinces have failed to adopt measures to reduce the level of pollution caused by smoke - emitting vehicles, especially buses, trucks and rickshaws. The EPDs have also failed to control industrial pollution with the result that our rivers and streams are getting increasingly contaminated by untreated effluent released into them. And sometimes, like in the case of damage to mangroves forests, the abusers are civic and other official agencies themselves. Pollution of water brings the threat of disease and destruction of plant and aquatic life. Noise pollution is on the increase, affecting health and environment. Land is being lost to misuse, often to the detriment of vegetation and wild life. On all these fronts, the performance of EPDs has been rather disappointing.

3. Causes of Environmental Abuse

The changes now occurring in the global eco-system are obviously the consequences of human activity. There are different views on why environmental abuse is taking place. Here we shall highlight some of the different views to see which ones make the most sense in the present set of circumstances.

i. Human nature

Some feel that environmental abuse is a result of human nature. People, it is alleged, are basically dirty. This being the case, there is really no way to stop the destruction of the environment short of eliminating people from global eco-system.

Scanned with CamScanner

This view is very seductive because of its simplicity. But there is no evidence that it is correct. Other animals do not violate the chains and cycles on which their survival is based. There is no evidence to suggest that people cannot do the same. Human beings are capable of making conscious and rational choices as to how they wish to relate to the rest of the eco-system. Over time, our choices have been ecologically disastrous. But our awareness of environmental deterioration offers the possibility of our choosing to end it.

ii. Population growth

Environmental deterioration, it is alleged, is an inevitable outcome of loading the earth with too many people. The more people there are, the greater impact they make on the eco-system as a whole. Increased world population means increased demands on finite resources, along with more waste disposal problems, land misuse, pollution and so on. The solution to environmental abuse, in this view, is to limit or even decrease the world's population -particularly in the poor countries where a "population explosion" is well underway.

No doubt, population growth and size have something to do with the demands being made on the eco-system. But population alone does not explain the problem.

iii. Loss of control over science and technology

Many who reject the population argument blame environmental deterioration on modern science and technology. Somehow, it is alleged, modern science and technology have taken on a life of their own. We have lost control of the tools that originally were developed to conquer nature and are being forced to bow to their imperatives and environmental deterioration is the result.

The only way to save the environment, according to this view, is to smash the test tubes and machines, close the mines and factories and lock the laboratories. We cannot solve the problem with more technology. People must retreat to those "golden years" of the past when small groups of families lived simply.

Obviously, science and technology are tools, and tools can be used in many different ways. How we use them is a matter of choice. We can use science and technology to help us live in harmony with the rest of the ecosystem or to hasten its collapse.

iv. Economic organization

Finally, the profit-seeking orientation of capitalism has been blamed. In this view, the eco-catastrophe is a result of a system of economic organization that benefits only a tiny percentage of the world's peoples. The benefits -wealth, power and prestige - may prove to be hallowing ones for the few that enjoy them.

In capitalist societies, economic and political priorities often place profits before people. Environmental abuse is an inevitable by-product of the private pursuit of money. Eliminate capitalism as a way of organizing and operating productive system, say proponents of this view, and you undercut the coming ecological collapse.

Capitalism plus science and technology equals environmental deterioration. In other words, the organization and operation of our society, ecologically speaking, harms living things including people. However, there is little consensus on causes.

4. National Conservation Strategy (NCS)

A brief description of the fourteen core development programmes of the NCS is given below:

i. Maintaining soils in croplands

The major problem facing soil in irrigated areas is water logging and salinity. For this the target of the 8th Plan was supposed to provide drainage for all saline areas where the water table is within 5 feet of the surface.

Another major problem facing the soil is rapid depletion of organic content. This can be treated only through persuading the rural community to adopt green managing and incorporating crop residues in the soil. Other steps to be taken in this field are planting of field border trees and practicing saline agriculture where needed.

ii. Increasing Irrigation efficiency

Irrigation Systems Rehabilitation Programme and Command Water Management are already under implementation. On-Farm Water Management, with the cooperation of local village communities, will have to be extended rapidly. Small storage and water harvesting projects may also have to be encouraged in relevant areas.

iii. Protecting watersheds

For effective action, it is essential to have support and cooperation of village communities. In certain areas forest development would be essential for soil conservation.

iv. Supporting forestry and plantations

Forest management will have to be strengthened in government forests. Also, area under government forests needs to be extended. In the private sector, agriculturists can be encouraged to plant trees in marginal land and on borders of fields.

v. Restoring rangeland and improving livestock

The productivity of rangelands will have to be increased through controlled grazing and introduction of high yield fodder. In certain areas, stall feeding of animals may have to be restored too. Livestock quality programme will be successful only with the cooperation of the local village communities.

vi. Protection of water bodies and sustaining fisheries

It is necessary to replace poisonous pesticides through biologically controlled pest management. This will improve quality of water bodies and facilitate fish farming. Treatment of sewage water will be an important part of the programme.

vii. Increasing energy efficiency

Waste of power would be avoided by up-grading transmission and distribution facilities and effecting power factor improvement. Energy audit of industries will be conducted and saving of energy ensured by adopting suitable measures including boiler tune-ups.

Scanned with CamScanner

viii. Conserving biodiversity

The programme involves the development of national parks and game reserves. Action will also be initiated for preservation of endangered species.

ix. Developing and deploying renewables

Agricultural and domestic wastes will be used for generation of energy on experimental basis. Bio-gas will be introduced as well as solar cookers and solar water heaters. Beginning will be made to install windmills and hydel plants.

x. Preventing and abating pollution

Industries will be encouraged to set up plants which avoid creating toxic wastes. Pollution abatement equipment will be installed in existing industrial units which pose health hazards. EPA vehicle emission standards will be applied and engine tuning will be made compulsory.

xi. Managing urban wastes

A beginning will be made to establish sanitary landfill. Investments will be made in sewage treatment plants and oxidation ponds.

xii. Supporting institutions for common resources

Government has decided to launch a country-wide programme for rural support and empowerment of village communities.

xiii. Integrating population and environment programmes

Government has decided to accelerate the family planning programme. Special attention will be paid to extend the programme to ecologically fragile zones.

xiv. Preservation of cultural heritage

Government has decided to increase funds for preserving archaeological buildings and cultural heritage.

5. Environment Related Laws

Presently, a number of environment related laws such as Wildlife Protection, Pesticide Control, Motor Vehicles Emission's Regulation, and Control of Industrial Pollution through Pakistan Environmental Protection Ordinance, 1983 exist. However, these laws are not being implemented fully and effectively.

6. Pakistan Environmental Protection Act, 1997

The Act provides framework for implementation of the NCS which includes establishment of provincial sustainable development funds; protection and conservation of wildlife; habitat and biodiversity; establishment of environmental tribunals, initial environment examination; environmental impact assessment; and protection of public education and awareness of environmental issues through mass media.

7. Extent of Environmental Abuse

In the following pages an attempt has been made to delineate the major environmental problems in Pakistan.

8. Air Pollution

Most of us take the life-sustaining activity of breathing for granted. But threats to this activity have been emerging all around us as a result of "Dirty air". Air pollution occurs when so many contaminations are released into the atmosphere that the recycling and cleansing functions begin to breakdown. Pollution is concentrated most notably in cities and towns where most people live. The major contributors are power plants and transportation vehicles. Hydrocarbons also play a role in smog formation. Hydrocarbons, which make up 15 percent of pollution tonnage, are primarily emitted by automobiles.

Vehicular pollution is one of the largest sources of air pollution in our cities. The total vehicles in the country which were about 0.85 million in 1992 are estimated to exceed 17 million by the year 2020. Karachi is among the top ten cities of the world with the highest level of lead poisoning. Other Provincial capitals are not too far behind where the high level of pollutants spewed into the air is concerned.

A government study reveals that 45 percent of urbanites are directly affected by air pollution. The impact on health is proving to be devastating as toxic emissions, with their high carcinogenic lead content, has led to a series of ailments from respiratory disorders and skin allergies to low IQs, even mental retardation, among children.

No doubt, the law must be enforced to reduce the level of industrial and vehicular emissions that are making life difficult for urban dwellers. There must be some checks whereby the owners of the vehicles with defective emission systems are taken to task and made to repair the fault. However, without the participation of the citizens, who must be taught to respect environmental guidelines, the Government will not be able to achieve the goal towards lowering pollution levels.

9. Noise Pollution

A survey conducted by the Urban Resource Centre has revealed that the level of noise pollution is higher than tolerable. The endurable limit, according to experts, is 85 decibels whereas in places in the city it has been measured to be much above this, even up to 104 decibels. Constant exposure to such a high level of noise can lead to audio logical, biological and behavioural malfunctions. Studies on the effect of constant exposure to high-pitched noise on people have shown that most of them suffer from hearing difficulty; they also become irritable, besides running the risk of other serious disorders. Noise pollution also affects the learning ability of children, impairing their comprehension and ability to distinguish between different sounds.

A major factor in the worsening problem of noise pollution is a constant increase in the number of motor vehicles in the city. Among the latter, auto-rickshaws, most of which are without the silencers to muffle their noise, are the biggest culprits. Some heavy vehicles like trucks and buses too are fitted with damaged or sub-standard silencers. Unless these two major sources are tackled effectively, no progress in any drive for controlling noise pollution is conceivable.

Scanned with CamScanner

10. WATER POLLUTION

Water pollution constitutes a threat that is just as serious as the abuse of the air. Pollution of surface water may expose human beings to a host of new diseases. According to a World Bank Report, patients of water-borne diseases occupy on average three out of every four hospital beds in the country. The high infant mortality rate is attributable largely to diseases related to water. These figures are hardly surprising when one considers the fact that only 62 per cent of the population has access to potable water and about 39 per cent can avail themselves of reasonable sanitation facilities.

Little environmental awareness and poor planning is largely to be blamed for a situation where water-borne diseases have become so widely prevalent. The use of pesticides in rural areas has contaminated the already brackish ground water, making it undrinkable for hundreds of thousands of people who sink tube-wells for want of water from other resources. In urban areas, untreated industrial waste seeps into water channels. Besides, haphazard planning by Municipal authorities is responsible for the close proximity of sewers and water lines so that it is not uncommon to see faecal matter floating about in water meant for drinking purpose. Unless the situation is rectified soon, the affected localities might be facing the outbreak of water borne diseases such as hepatitis-A, diarrhoea and gastro-enteritis, which are quite common in Karachi and other cities. A study earlier conducted by the Environment Protection Department in the Ravi Basin has brought home the disastrous consequences of industrial waste polluting water. In most cases, the dissolved oxygen content in the water ways was below the desired level and it was mostly polluted by industrial waste and sewage from residential areas. Neither was it suitable for irrigation. Around 200 industrial units were found to be disposing of their effluents in one *nullah* in Sheikhupura District alone. The polluting industries included tanneries, sizing factories, textile related units, recasting mills and a glue unit. Unfortunately, the Punjab Government's own contribution for conservation is far too meagre to tackle the problem on a long term basis. This is in spite of the fact that the proposals for detailed monitoring were part of the national drainage programme in the Indus Basin.

Before the situation worsens, the authorities would do well to set about rectifying this state of affairs. This would include educating the public about the dangers of drinking contaminated water and also overhauling the distribution network and imposing penalties on those responsible for injudicious use of pesticides in the fields and for releasing untreated effluents into water channels.

11. INDUSTRIAL POLLUTION

Owing to unplanned setting up of new industrial units and expansion of existing ones within municipal limits throughout the country, an acute environmental degradation is being caused, giving rise to many health problems. These industries emit smoke laden with hazardous gases and particulate matter which is responsible for air pollution. Fertilizer factory releases Ammonia, Fluorine, Nitric Oxide etc. which cause respiratory and lung diseases. Oil refineries and paper industries release sulphur dioxide and chlorine gas which cause respiratory diseases, eye diseases and high concentration of these gases can ultimately cause death.

Hundreds of industrial units have sprung up in other major urban centres, including Lahore, Faisalabad, Multan and Gujranwala. Many of these are located in congested residential areas and the menace is constantly growing for want of any effective check. Industrial effluents from dying, printing and calendaring units in Faisalabad are reported to have made life miserable for residents in some localities littered as they usually are with heaps of garbage, filth and pools of contaminated water in the streets.

Usually the effluent from industries is thrown directly into rivers or sea without any treatment. This effluent is a threat to the aquatic life and fish consumed from polluted waters causes various harmful diseases. There is urgent need for effective application of laws banning discharge of untreated industrial effluents into rivers or sea to ensure safe water and marine life.

12. MARINE POLLUTION

Pakistan lacks a proper strategy to deal with the problem of marine pollution, with the result that untreated effluents are poured out into the sea without any check. Marine pollution is caused largely by land-based sources, especially sea-side industries and municipal sewers. However, there have been instances where the pollution has come from ships when a ship discharged a large quantity of untreated oil in the waters near Karachi. As a result of this oil spill, vast areas of the mangroves belt along the coast were affected. Mangroves have innumerable commercial and other uses. Not only do they form natural breeding grounds and nurseries for certain varieties of fish and other species of marine life, they also act as barriers against high winds that can otherwise harm coastal eco-system.

Knowing harmful effects of marine pollution, it is important to evolve a comprehensive system of prevention and control to ensure that the practice of discharge of industrial and municipal effluents into the sea and other waterways is brought within some regulation. As for oil spills, the need is all the greater in view of the fact that one of the world's busiest sea routes with over 15 tankers carrying over 0.6 million tons of oil to other parts of the world a day runs through Pakistan's Exclusive Economic Zone, posing a threat of pollution to its coastal waters and damage to marine life there.

13. IMPACT OF POLLUTION

a. **Air:** The key factors contributing to air pollution in Pakistan are: (a) rapid growing energy demand, and (b) a fast growing transport sector. In the cities, widespread use of low-quality fuel, combined with a dramatic expansion in the number of vehicles on roads, has led to significant air pollution problems. Air pollution levels in Pakistan's most populated cities are among the highest in the world and causing serious health issues. The levels of ambient particulates - smoke particles and dust, which cause respiratory disease - are generally twice the world average and more than five times as high as in industrial countries and Latin America. Although Pakistan's energy consumption is still low by world standards, lead and carbon emissions are major air pollutants in urban centres such as Karachi, Lahore, Rawalpindi and Peshawar.

b. **Coal:** Coal is another main contributor to dirty air. The three main uses of coal are for power, brick-kilns and domestic. A number of plants have now been converted to natural gas. Likewise, there has been a considerable reduction in coal usage for domestic purposes.

c. **Water:** Per capita water availability in Pakistan has been decreasing at an alarming rate. In 1951, per capita availability was 5300 cubic meters, which has now decreased to 1017 (in 2019) cubic meter just touching water scarcity level of 1000 cubic meter. The productivity

Scanned with CamScanner

of fresh water is also decreasing due to losses in movement of the water from the canal heads to the croplands. The existing water resources are under threat due to rapid degradation, soil erosion, deforestation and untreated discharge of municipal and industrial wastes to rivers and other water bodies. Municipal water is treated only in two cities viz. Karachi and Islamabad though the capacity of these treatment plants is much less than the actual quantum of wastewater. Over-fishing and polluted water are reducing the productivity of the marine and inshore fisheries. This situation is precarious, in particular, for mangroves in the coastal zone and certain aquatic wildlife, such as the Indus freshwater dolphin. All of these activities are contributing to the destruction of habitats and, more generally, to a loss of biodiversity.

The investigational study conducted by Pakistan Council of Research in Water Resources indicates that water in many cities of Pakistan is unsafe for human consumption due to both bacterial and chemical contamination. The overall deteriorating quality of water can be attributed to a continuous drop in the water table due to high industrial and agricultural demands. It has been observed that the water table has been decreasing at a rate of 10 feet every year.

d. **Land:** The productivity of soil is being lost due to water logging, salinisation and sodicity. It is estimated that about 38 percent of Pakistan's irrigated land is water logged, 14 per cent is saline and the application of agricultural chemicals has increased by a factor of almost 10. Forest is being lost every year, and Baluchistan's Juniper forests, unique in the world, continue to be cut beyond their capacity to regenerate.

In the urban areas, less than 60 per cent of solid waste is collected. No city in Pakistan has proper waste collection and disposal system for municipal or hazarders wastes. Our industries use about 525 types of chemicals and dyes/colour in different processing industries. Their processing generates wastes causing contamination of soil and poses potential risk to public health and damage the fertility of cropland.

14. Policies and Programmes

The National Conservation Strategy (NCS) represents the broad national environment policy of Pakistan, within which a National Environment Action Plan (NEAP) has also been approved. The main objectives of NEAP are to safeguard public health, promote sustainable livelihood and enhance quality of life for the people of Pakistan. It focuses on clean air, clean water, solid water management and eco-system management. The government has also formulated a comprehensive strategy to develop provincial capacity for implementing environmental protection laws and monitoring their effectiveness. The following strategies and plans are envisaged:

i. National resettlement safeguard policy (NRSP)

The NRSP will be promulgated to minimize negative environmental and social impacts of land acquisition and rehabilitation for national projects, and displacement of native people.

ii. National response strategy on climate change

This policy-guiding document is also nearing completion, which envisages policies and action plans to combat adverse impacts of climate change on different sectors economy, with existing sources of technical and financial cooperation.

iii. National land use programme: other plans

This includes Forest Sector Master Plan, National Forest Policy, Biodiversity Action Plan and Desertification Combat Action Plan. Maritime Policy is currently under preparation, which will be finalized and implemented. Integrated Coastal Zone management Plan will be formulated.

Conservation will focus on the following areas:

Energy Efficiency and Renewable Energy: Energy efficiency will significantly improve by implementing an efficiency plan. Conventional sources of energy will be conserved. The proportion of renewable sources will be increased incrementally in the coming decades. Pakistan Council for Renewable Energy Technology (PCRET) would undertake a comprehensive action plan for development of non-conventional technology.

Land and Water: Irrigation and water management systems need both short- term and long-term rectification to minimize water distribution losses, overriding principle of the on-going National Drainage Programme (NDP)[not to pollute Indus Basin System and fresh water reservoirs by discharging saline effluents. The on-farm water management (OFWM) programme will line and renovate existing 90,000 watercourses to enhance irrigation efficiency up to 70%. Efficient irrigation methods along with lining of existing canal networks will be adopted to economize water use and to control water logging and salinity.

Forests: State-owned forests will be regenerated and protected with intimate involvement of local communities in forests management. Local governments and union councils would bring in more private marginal lands under cover within a defined legal framework to avoid alienation of land use State-owned wastelands may be leased out to tenants for expansion of forest cover.

15. Conclusion

In sum, it is regrettable that such an elaborate piece of legislation as the Pakistan Environmental Protection Act (PEPA) should have no effect on the reduction of factories, workshops and sources of emission that have led air pollution levels in Karachi and Lahore to be 20 times higher than World Health Organization standards. Millions in the country are regularly treated for pollution-related sickness, and their numbers continue to grow. Meanwhile, untreated toxic effluents from industrial discharge are poisoning the country's water-ways and killing marine life.

With this state of affairs, one wonders what the government environmental bodies are doing to monitor the situation. What is worse is that there are no citizens' bodies to protest against environmental pollution. The Government would do well to review the environment policy it has formulated and, as empowered by PEPA, begin to implement it in right earnest.

CHAPTER 11

POVERTY IN PAKISTAN

1. INTRODUCTION

Poverty is deprivation, a denial of access to those things which make a life of dignity possible, including not only food, shelter and safe drinking water, but also such as 'intangibles' as the opportunity to learn, to engage in meaningful employment or to enjoy the respect of one's fellow citizens. While some define poverty primarily in economic terms, others consider social and political factors to be intrinsic. The ongoing debates around the causes, effects, and best ways to measure poverty directly influence the design and implementation of poverty reduction programs, and are therefore relevant to the fields of international development and public administration. Although poverty is generally considered to be undesirable due to the pain and suffering it may cause, in certain spiritual contexts, 'voluntary poverty' involving the renunciation of material goods, is seen as virtuous by some.

Poverty is a condition which may affect individuals or collective groups, and is not confined to the developing nations. Poverty in developed countries is manifest in a set of social problems including homelessness and the persistence of 'ghetto' housing clusters.

2. MEASURING POVERTY

When measured, poverty may be absolute or relative poverty. Absolute poverty refers to a set standard which is consistent over time and between countries. An example of an absolute measurement would be the percentage of the population eating less food than is required to sustain the human body (approximately 2000-2500 calories per day for an adult male).

Economic aspects of poverty may focus on material needs, typically including the necessities of daily living, such as food, clothing, shelter, or safe drinking water. Poverty in this sense may be understood as a condition in which a person or community is lacking in the basic needs for a minimum standard of well-being and life, particularly as a result of a persistent lack of income.

Analysis of social aspects of poverty links conditions of scarcity to aspects of the distribution of resources and power in a society and recognizes that poverty may be a function of the diminished "capability" of people to live the kinds of lives they value. The social aspects of poverty may include lack of access to information, education, health care, or political power. Poverty may also be understood as an aspect of unequal social status and inequitable social relationships, experienced as social exclusion, dependency, and diminished capacity to participate, or to develop meaningful connections with other people in society.

The World Bank's "Voices of the Poor," based on research with over 20,000 poor people in 23 countries, identifies a range of factors which poor people identify as part of poverty. These include:

- Precarious livelihoods
- Excluded locations
- Physical limitations
- Gender relationships
- Problems in social relationships
- Lack of security
- Abuse by those in power
- Disempowering institutions
- Limited capabilities, and
- Weak community organizations.

As of 2017, Pakistan's Human Development Index (HDI) is 0.562, significantly lower than Bangladesh's HDI, which is 0.608. Bangladesh was formerly another part of the country and had a much lower HDI. Pakistan's HDI is one of the lowest in South Asia, after Yemen, Afghanistan and Syria.

Wealth distribution in Pakistan is slightly varied, with the top 10% of the population earning 27.6% and the bottom 10% earning only 4.1% of the income. Pakistan generally has a low gini co-efficient and therefore a decent distribution of income (relatively lower inequality). According to the United Nations Human Development Report, Pakistan's human development indicators, especially those for women, fall significantly below those of countries with comparable levels of per-capita income. Pakistan also has a higher infant mortality rate (88 per 1000) than the South Asian average (83 per 1000).

As of 2017, the Asian Development Bank reports that there are approximately 210 million people living in Pakistan. In 2011, 12.4% of Pakistanis live below in Pakistan's definition of poverty. Statistics vary due to the definition of poverty. According to the World Bank, poverty in Pakistan fell from 64.3% in 2002 to 29.5% in 2014. Pakistan has made substantial progress in reducing poverty giving it the second lowest headcount poverty rate in South Asia.

Relative poverty views poverty as socially defined and dependent on social context. Income inequality is a relative measure of poverty. A relative measurement would be to compare the total wealth of the poorest one-third of the population with the total wealth of richest 1% of the population. There are several different income inequality metrics. One example is the Gini coefficient.

The 2007 World Bank report "Global Economic Prospects" predicts that in 2030 the number living on less than the equivalent of $1 a day will fall by half, to about 550 million. An average resident of what we used to call the Third World will live about as well as do residents of the Czech or Slovak republics today. However, much of Africa will have difficulty keeping pace with the rest of the developing world and even if conditions there improve in absolute terms, the report warns, Africa in 2030 will be home to a larger proportion of the world's poorest people than it is today. However, economic growth has increased rapidly in Africa after the year 2000.

Scanned with CamScanner

In many developed countries the official definition of poverty used for statistical purposes is based on relative income. As such many critics argue that poverty statistics measure inequality rather than material deprivation or hardship. For instance, according to the U.S. Census Bureau, 46% of those in "poverty" in the U.S. own their own home (with the average poor person's home having three bedrooms, with one and a half baths, and a garage). Furthermore, the measurements are usually based on a person's yearly income and frequently take no account of total wealth. The main poverty line used in the OECD and the European Union is based on "economic distance", a level of income set at 50% of the median household income. The US poverty line is more arbitrary. It was created in 1963-64 and was based on the dollar costs of the U.S. Department of Agriculture's "economy food plan" multiplied by a factor of three. The multiplier was based on research showing that food costs then accounted for about one third of the total money income. This one-time calculation has since been annually updated for inflation.

3. Possible Causes of Poverty

Urban poverty is common in developing countries. Many different factors have been cited to explain why poverty occurs. However, no single explanation has gained universal acceptance. At the international level some emphasise global systemic causes, (such as trade, aid and debt, the focus of the Make Poverty History campaign), while others point to national level deficiencies of public administration and financial management, the focus of the Good Governance agenda of the international financial institutions. At the national level, some point to personal factors, such as drug use, work ethic and education level as the main cause of poverty, while others indicate inadequate social services and policies biased in favour of the wealthy and social elite, as a cause of enduring poverty.

Other possible factors include:

i. Environmental factors

- **Erosion.** Intensive farming often leads to a vicious cycle of exhaustion of soil fertility and decline of agricultural yields and thence increased poverty.
- **Desertification and overgrazing.** Approximately 40% of the world's agricultural land is seriously degraded. In Africa, if current trends of soil degradation continue, the continent might be able to feed just 25% of its population by 2025, according to UNU's Ghana-based Institute for Natural Resources in Africa.
- **Deforestation** as exemplified by the widespread rural poverty in China that began in the early 20th century and is attributed to non-sustainable tree harvesting.
- **Natural factors** such as the climate change or environment
- **Geographic factors,** for example access to fertile land, fresh water, minerals, energy, and other natural resources. Presence or absence of natural features helping or limiting communication, such as mountains, deserts, sailable rivers, or coastline. Historically, geography has prevented or slowed the spread of new technology to areas such as the Americas and Sub-Saharan Africa. The climate also limits what crops and farm animals may be used on similarly fertile lands
- On the other hand, research on the resource curse has found that countries with an abundance of natural resources creating quick wealth from exports tend to have less long-term prosperity than countries with less of these natural resources.
- Drought and water crisis.

ii. Economic factors

- Unemployment.
- Capital flight by which the wealthy in a society shift their assets to off-shore tax havens deprives nations of revenue needed to break the vicious cycle of poverty.
- Weakly entrenched formal systems of title to private property are seen by writers such as Hernando de Soto as a limit to economic growth and therefore a cause of poverty.
- Communists see the institution of property rights itself as a cause of poverty.
- Unfair terms of trade, in particular, the very high subsidies to and protective tariffs for agriculture in the developed world. This drains the taxed money and increases the prices for the consumers in developed world; decreases competition and efficiency; prevents exports by more competitive agricultural and other sectors in the developed world due to retaliatory trade barriers; and undermines the very type of industry in which the developing countries do have comparative advantages.
- Tax havens which tax their own citizens and companies but not those from other nations and refuse to disclose information necessary for foreign taxation. This enables large scale political corruption, tax evasion, and organized crime in the foreign nations.

iii. Health care

- Poor access to affordable health care makes individuals less resilient to economic hardship and more vulnerable to poverty.
- Inadequate nutrition in childhood, itself an effect of poverty, undermines the ability of individuals to develop their full human capabilities and thus makes them more vulnerable to poverty. Lack of essential minerals such as iodine and iron can impair brain development. It is estimated that 2 billion people (one-third of the total global population) are affected by iodine deficiency, including 285 million 6- to 12-year-old children. In developing countries, it is estimated that 40% of children aged 4 and under suffer from anaemia because of insufficient iron in their diets. See also Health and intelligence.
- Disease, specifically diseases of poverty: AIDS, malaria, and tuberculosis and others overwhelmingly afflict developing nations, which perpetuate poverty by diverting individual, community, and national health and economic resources from investment and productivity. Further, many tropical nations are affected by parasites like malaria, schistosomiasis, and trypanosomiasis that are not present in temperate climates. The Tsetse fly makes it very difficult to use many animals in agriculture in afflicted regions.
- Clinical depression undermines the resilience of individuals and when not properly treated makes them vulnerable to poverty.
- Similarly substance abuse, including for example alcoholism and drug abuse when not properly treated undermines resilience and can consign people to vicious poverty cycles.

iv. Governance

- Lacking democracy in poor countries: "The records when we look at social dimensions of development—access to drinking water, girls' literacy, and health care—are even more starkly divergent. For example, in terms of life expectancy, poor democracies typically enjoy life expectancies that are nine years longer than poor autocracies. Opportunities of

Scanned with CamScanner

finishing secondary school are 40 percent higher. Infant mortality rates are 25 percent lower. Agricultural yields are about 25 percent higher, on average, in poor democracies than in poor autocracies—an important fact, given that 70 percent of the population in poor countries is often rural-based." Poor democracies don't spend any more on their health and education sectors as a percentage of GDP than do poor autocracies, nor do they get higher levels of foreign assistance. They don't run up higher levels of budget deficits. They simply manage the resources that they have more effectively."

- The governance effectiveness of governments has a major impact on the delivery of socioeconomic outcomes for poor populations
- Weak rule of law can discourage investment and thus perpetuate poverty.
- Poor management of resource revenues can mean that rather than lifting countries out of poverty, revenues from such activities as oil production or gold mining actually leads to a resource curse.
- Failure by governments to provide essential infrastructure worsens poverty.
- Poor access to affordable education traps individuals and countries in cycles of poverty.
- High levels of corruption undermine efforts to make a sustainable impact on poverty. In Nigeria, for example, more than $400 billion was stolen from the treasury by Nigeria's leaders between 1960 and 1999.

v. Demographics and social factors

- Overpopulation and lack of access to birth control methods. Note that population growth slows or even become negative as poverty is reduced due to the demographic transition.
- Crime, both white-collar crime and blue-collar crime, including violent gangs and drug cartels.
- Historical factors, for example imperialism, colonialism and communism (at least 50 million children in Eastern Europe and the former Soviet Union live in poverty).
- Brain drain
- Matthew effect: the phenomenon, widely observed across advanced welfare states, that the middle classes tend to be the main beneficiaries of social benefits and services, even if these are primarily targeted at the poor.
- Cultural causes, which attribute poverty to common patterns of life, learned or shared within a community. For example, Max Weber argued that the Protestant work ethic contributed to economic growth during the industrial revolution.
- War, including civil war, genocide, and democide.
- Discrimination of various kinds, such as age discrimination, stereotyping, gender discrimination, racial discrimination, caste discrimination.
- Individual beliefs, actions and choices.

4. Effects of Poverty

The effects of poverty may also be causes, as listed above, thus creating a "poverty cycle" operating across multiple levels, individual, local, national and global.

Those living in poverty and lacking access to essential health services, suffering hunger or even starvation, experience mental and physical health problems which make it harder for them to improve their situation. One third of deaths - some 18 million people a year or 50,000 per day - are due to poverty-related causes: in total 270 million people, most of them women and children, have died as a result of poverty since 1990. Those living in poverty suffer lower life expectancy. Every year nearly 11 million children living in poverty die before their fifth birthday. Those living in poverty often suffer from hunger. 800 million people go to bed hungry every night. Poverty increases the risk of homelessness. There are over 100 million street children worldwide. Increased risk of drug abuse may also be associated with poverty.

Pakistan's Unemployment Rate

Last	Previous	Min	Max	Unit	Frequency	Range
5.79	5.94	3.04	8.27	%	Yearly	1980 - 2018
2018	2015	1986	2003			Updated on 29 Mar 2019

Those living in poverty in the developed world may suffer social isolation and rates of suicide may increase in conditions of poverty. Death of a breadwinner may decrease a household's resilience to poverty conditions and cause a dramatic worsening in their situation. Low income levels and poor employment opportunities for adults in turn create the conditions where households can depend on the income of child members. An estimated 218 million children aged 5 to 17 are in child labour worldwide, excluding child domestic labour. Lacking viable employment opportunities those living in poverty may also engage in the informal economy, or in criminal activity, both of which may on a larger scale discourage investment in the economy, further perpetuating conditions of poverty.

Low income and wealth levels undermine the ability of governments to levy taxes for public service provision, adding to the 'vicious circle' connecting the causes and effects of poverty. Lack of essential infrastructure, poor education and health services, and poor sanitation contribute to the perpetuation of poverty. Poor access to affordable public education can lead to low levels of literacy, further entrenching poverty. Weak public service provision and high levels of poverty can increase states' vulnerability to natural disasters and make states more vulnerable to shocks in the international economy, such as those associated with rising fuel prices, or declining commodity prices.

The capacity of the state is further undermined by the problem that people living in poverty may be more vulnerable to extremist political persuasion, and may feel less loyalty to a state unable to deliver basic services. For these reasons conditions of poverty may increase the risk of political violence, terrorism, war and genocide, and may make those living in poverty vulnerable to human trafficking, internal displacement and exile as refugees. Countries suffering widespread poverty may experience loss of population, particularly in high-skilled professions, through emigration, which may further undermine their ability to improve their situation.

5. Poverty in Pakistan

Poverty in Pakistan is a major socio-economic issue. Nearly one-quarter of the population is classified poor as of October 2007. The declining trend on poverty in the country seen during the 1970s and 1980s was reversed in the 1990s by poor Federal policies and rampant corruption. This phenomenon has been referred to as the "Poverty Bomb". The government of Pakistan has

Scanned with CamScanner

prepared an "Interim Poverty reduction Strategy Paper" that suggest guidelines to reduce poverty in the country. According to the World Bank, the program has had tangible success, with the World Bank stating that poverty has fallen by 5 percent since 2000.

As of 2006, Pakistan's Human Development Index is 0.539, higher than that of nearby Bangladesh (0.530), which was formerly a part of Pakistan, but lower than that of neighbouring India (0.611).

Incidences of poverty in Pakistan rose from 22–26% in the Fiscal Year 1991 to 32–35% in the Fiscal Year 1999. They have subsequently fallen to 25-26% according to the reports of the World Bank and UN Development Program reports. These reports contradict the claims made by the Government of Pakistan that the poverty rates are only 23.1%. The CIA Fact book places the 2006 poverty rate at 24 percent. For every 1,000 babies born in Pakistan in 2017, 75 die before their fifth birthday.

According to "The News 26 July 2019", the most incurable disease for Pakistan is inflation which is devouring the poor day by day. Our people live a very vulnerable life because of poverty. Nearly 39 percent of Pakistanis live under multidimensional poverty. More than a third of Pakistan's population is living below the poverty line. Balochistan has the highest rate of poverty; Sindh comes second, followed by Khyber Pakhtunkhwa and then Punjab.

According to experts, our poverty is caused by inflation, unequal distribution of resources, and lack of facilities, high unemployment rates, and growing population. Inflation has become an epidemic disease which gives birth to multiple issues. It is hoped that government would cure this problem and facilitate the people.

i. Spatial distribution of poverty

Poverty in Pakistan has historically been higher in rural areas and lower in the cities. Out of the total 40 million living below the poverty line, 30 million live in rural areas. Poverty rose sharply in the rural areas in the 1990s and the gap in income between urban and rural areas of the country became more significant. This trend has been attributed to a disproportionate impact of economic events in the rural and urban areas.

There are also significant in homogeneities in the different regions of Pakistan that contribute to the country's rising poverty. In the 1999 Fiscal year, the urban regions of the Sindh province had the lowest levels of poverty, and the rural areas of the Khyber Pakhtunkhwa Province had the highest. Punjab also has significant gradients in poverty among the different regions of the province.

In addition, the North Western Frontier Provinces of Pakistan are among the most impoverished in the country. Outside the cities, government investment has been negligible, and social and economic structures remained tribal and backward. In the absence of economic development, the Pushtun people of the region dealt in arms and drugs, smuggling people and goods, especially during the Soviet invasion of neighbouring Afghanistan and, later, in support of the Taliban regime. These and other activities have led to a breakdown of law and order in many parts of the region.

ii. Poverty and gender

The gender discriminatory practices in Pakistani society also shape the distribution of poverty in the country. Traditional gender roles in Pakistan define the woman's place as in the home and not in the workplace, and consequently, the society invests far less in women than men. Women in Pakistan suffer from poverty of opportunities throughout their lives. According to Federal Ministry of Education (2018) Female literacy in Pakistan is 51.8% compared to Male literacy at 72.5%. In legislative bodies, women constituted less than 3% of the legislature elected on general seats before 2002. The 1973 Constitution allowed reserved seats for women in both houses of parliament for a period of 20 years, thus ensuring that women would be represented in parliament regardless of whether or not they are elected on general seats. This provision lapsed in 1993, so parliaments elected subsequently did not have reserved seats for women. Reserved seats for women have been restored after the election of 2002. Female labour rates in Pakistan are exceptionally low.

All this, coupled with the rise of honour killings against women, a legal system that is regarded as misogynistic, and the intransigent denial of these problems by the Pakistan government, as well as their institutionalized harassment of women's rights groups operating in the country, contribute to the deteriorating situation with women and the rise in their poverty.

"Vulnerability" in this case stands for the underlying susceptibility of economically deprived people to fall into poverty as a result of exogenous random shocks. Vulnerable households are generally found to have low expenditure levels. Households are considered vulnerable if they do not have the means to smooth out their expenses in response to changes in income. In general, vulnerability is likely to be high in households clustered around the poverty line. Since coping strategies for vulnerable households depend primarily on their sources of income, exogenous shocks can increase reliance on non-agricultural wages. Such diversification has not occurred in many parts of Pakistan, leading to an increased dependence on credit.

While economic vulnerability is a key factor in the rise of poverty in Pakistan, vulnerability also arises from social powerlessness, political disenfranchisement, and ill-functioning and distortionary institutions, and these also are important causes of the persistence of vulnerability among the poor.

iii. Economic and social vulnerability

Other causes of vulnerability in Pakistan are the everyday harassment by corrupt government officials, as well as their underperformance, exclusion and denial of basic rights to many in Pakistan. Also, lack of adequate health care by the state lead the poor to seek private sources, which are expensive, but still preferable to the possibility of medical malpractice and being given expired medicines in state run medical facilities. Also, the failure by the state to provide adequate law and order in many parts of the country is a factor in the rise of vulnerability of the poor.

iv. Environmental issues

Environmental problems in Pakistan, such as erosion, use of agro-chemicals, deforestation etc. contributes to rising poverty in Pakistan. Increasing pollution contributes to increasing risk of toxicity, and poor industrial standards in the country contribute to rising pollution.

v. Lack of adequate governance

The manner in which power is exercised in the management of a country's social and economic resources for development emerged as Pakistan's foremost developmental problem.

Scanned with CamScanner

Corruption and political instabilities such as various separatist movements in Balochistan a Waziristan resulted in reduction of business confidence, deterioration of economic growt reduced public expenditure, poor delivery of public services, and undermining of the rule of la The perceived security threat on the border with India has dominated Pakistan's culture and h led to the domination of military in politics, excessive spending on defence at the expense social sectors, and the erosion of law and order.

Pakistan has been run by military dictatorships for large periods of time, alternating wit limited democracy. These rapid changes in governments led to rapid policy changes and reversa and the reduction of transparency and accountability in government. The onset of militar regimes has contributed to non-transparency in resource allocation. In particular, the neglect b the Pakistani state of the Balochistan and North Western Frontier Provinces has rendered th region poverty-stricken. Those who do not constitute the political elite are unable to mak political leaders and the Government responsive to their needs or accountable to promises Development priorities are determined not by potential beneficiaries but by the bureaucracy and political elite which may or may not be in touch with the needs of the citizens. Political instabilit and macroeconomic imbalances have been reflected in poor creditworthiness ratings, eve compared to other countries of similar income levels, with resulting capital flight and lowe foreign direct investment inflows. The current government of Pakistan has professe commitments to reforms in this area.

In addition, Pakistan's major cities and urban centres are home to an estimated 1.2 millio street children. This includes beggars and scavengers who are often very young. The law an order problem worsens their condition as boys and girls are fair game to others who would force them into stealing, scavenging and smuggling to survive. A large proportion consumes readil available solvents to starve off hunger, loneliness and fear. Children are vulnerable to contractin STD's such as HIV/AIDS, as well as other diseases.

vi. Feudalism

Pakistan is home to a large feudal landholding system where landholding families hol thousands of acres and do little work on the agriculture themselves. They enlist the services o their serfs to perform the labour of the land. 51% of poor tenants owe money to the landlords. Th landlords' position of power allows them to exploit the only resource the poor can possibl provide: their own labour.

vii. Poverty and the rise of Islamic fundamentalism

The rise of poverty in the country has been correlated with the rise of Islami Fundamentalism in many parts of the country. The Pakistani government's attempts at propose reforms have been criticized as "weak" and have been associated with an "expedient brand o romance between the establishment and the religious right". The continued marginalization o liberal, democratic forces has aggravated the situation. One third of all children being educated i Pakistan attend ***madaris*** over secular schools. ***madaris*** education is offered on the pretext tha they provide better education than the much neglected secular schools. They study in a religiou environment that has been radicalized by the state-sponsored exposure of the "Holy Jihad" i Afghanistan and against India in Kashmir.

Poverty and the lack of a modern curriculum have proved destabilizing factors for Pakistani society that have been exploited by religious organizations banned by the government to run schools and produce militant literature. Though many ***madaris*** are benign, those that subscribe to the radicalist branches of Sunni Islam, such as the Deobandi and Wahabi sects draw recruits from the poor. ***Madaris*** under these entities provide Islamist education with a sectarian bias.

As a result, Islamist parties and clergy have become more powerful in Pakistan and have considerable sympathy among the poor. This phenomenon is also pronounced in the Khyber Pakhtunkhwa Province. The clergy have become more powerful in Pakistan and have considerable sympathy among the poor. This phenomenon is also pronounced in the Khyber Pakhtunkhwa Province.

viii. Feudalism: root cause of Pakistan's malaise?

Throughout history, feudalism has appeared in different forms. The feudal prototype in Pakistan consists of landlords with large joint families possessing hundreds or even thousands of acres of land. They seldom make any direct contribution to agricultural production. Instead, all work is done by peasants or tenants who live at subsistence level.

The landlord, by virtue of his ownership and control of such vast amounts of land and human resources, is powerful enough to influence the distribution of water, fertilisers, tractor permits and agricultural credit and, consequently exercises considerable influence over the revenue, police and judicial administration of the area. The landlord is, thus, lord and master. Such absolute power can easily corrupt, and it is no wonder that the feudal system there is humanly degrading.

The system, which some critics say is parasitical at its very root, induces a state of mind which may be called the feudal mentality. This can be defined as an attitude of selfishness and arrogance on the part of the landlords. It is all attitude nurtured by excessive wealth and power, while honesty, justice, love of learning and respect for the law have all but disappeared. Having such a mentality, when members of feudal families obtain responsible positions in civil service, business, industry and politics, their influence is multiplied in all directions. Indeed the worsening moral, social, economic and political crisis facing this country can be attributed mainly to the powerful feudal influences operating there.

Almost half of Pakistan's Gross National Product and the bulk of its export earnings are derived primarily from the agricultural sector controlled by a few thousand feudal families. Armed with a monopoly of economic power, they easily pre-empted political power.

To begin with, the Pakistan Muslim League, the party laying Pakistan's foundation 72 years ago, was almost wholly dominated by feudal lords such as the Zamindars, Jagirdars, Nawabs, Nawabzadas and Sardars, the sole exception being the Jinnahs. Pakistan's major political parties are feudal-oriented, and more than two-thirds of the National Assembly (Lower House) is composed of this class. Besides, most of the key executive posts in the provinces are held by them.

Through the 50s and the 60s the feudal families retained control over national affairs through the bureaucracy and the armed forces. Later on in 1972, they assumed direct power and retained it until the military regained power recently. Thus, any political observer can see that this oligarchy, albeit led by and composed of different men at different times, has been in power since Pakistan's inception.

Scanned with CamScanner

- **Socio-economic effect**

In the agrarian sector, it is the landowner who is excluded from the production process, while in industry; domestic technology is almost absent or kept at bay. Industrialisation over the past five decades has, to a large extent, been established and operated with foreign capital, technology and raw materials. As a result, native technology has remained stagnant and the rest of the economy is not integrated with industry.

Today, Pakistan depends mostly on foreign aid for industrial raw materials and spare parts. This dependence has caused severe weakness to its economy. Coupled with these shortcomings, nationalisation in the industrial sector has brought further injuries. Many industries, after nationalisation, suffered substantially. Consequently, the industrial policy has not only failed to create a sound industrial base and employment opportunities, but has instead increased unemployment.

In this connection, it can be pointed out that while much has been said against the families who accumulated wealth, there was little actually done against such a system. In such a system, a vast income-differential also exists which adversely affects Pakistan's balance of payments. One knows that higher income invariably leads to a greater tendency to import.

An analysis of an import bill would reveal that a substantial proportion of goods consist of non-essential consumer and luxury items. For example, a significant percentage of imported medicines consisting of vitamins and night pills for the fastidious rich rather than to combat or prevent disease. Further, the demand for luxury household appliances and electronic equipment proved to be so great that the ban on their importation was ineffective. These imports have led to international balance of payment deficits which foreign aid is attempting to bridge. As a result Pakistan's economy today is as aid-oriented as it was 10 or 20 years ago. It has thus continued its downward spiral.

- **Political effects**

The influence of feudalism has been most predominant in the political sphere. As stated earlier, Pakistan's administrative and political agencies are almost totally controlled at the higher echelons by feudal lords. Just as the salt in Pakistan's soil has retarded the growth of crops and vegetables, the feudal influence in the country's political soil has hindered the growth of democracy.

The relationship between the feudal mentality and the authoritarian tendency in Pakistan's political life is not difficult to perceive. Where feudal lords occupy positions as political executives, they tend to consider the country as their property and the citizens as their subjects.

Authoritarianism is thus entrained in the feudal personality and is as essential to the feudal system as oxygen is to human life. Freedom of thought and intellect, and freedom of speech and expression, invariably lead to the exposure of social inequities and injustices, mobilise public opinion and generate movements for establishing an egalitarian order.

Therefore, the first target of any feudal regime is the suppression of the press and academic institutions so as to give the regime the freedom to control, influence and manipulate to their own ends. A feudal regime, ultimately, may be conceived of as a regime of intellectual tyranny.

The political power of the feudal class is derived from their economic power, while their political power enables them to consolidate and expand their economic power. This combination has given them control over national affairs and enabled them to thwart democracy in maintaining their hegemony.

CHAPTER 12

POPULATION GROWTH IN PAKISTAN

1. INTRODUCTION

Population refers to the total human inhabitants of a specified area, such as a city, country, or continent, at a given time. Population study as a discipline is known as demography. It is concerned with the size, composition, and distribution of populations; their patterns of change over time through births, deaths, and migration; and the determinants and consequences of such changes. Births and immigration increase the size of the population; whereas, deaths and emigration decrease the size. The increase in the number of organisms in a population is referred to as population growth. Population studies yield knowledge important for planning, particularly by governments, in fields such as health, education, housing, social security, employment, and environmental preservation to formulate government population policies, which seek to modify demographic trends in order to achieve economic and social objectives. The numbers of births, deaths, immigrants, and emigrants over a specified time interval determine the change in population size. Two such widely used measures of population are the total fertility rate (TFR) and the life expectancy at birth.

Population by Age Group

Million

2. Population Growth and Economic Development

Some economists are of the view that, population does undermine a nation's economy because an increase in the number of people leads to an increase of the number of mouths to feed. The increase in demand for food leads to a decrease in natural resources, which are needed for a nation to survive. Other negative effects of population growth and, specifically, overpopulation include poverty caused by low income per capita, famine, and disease. Rapid population growth complicates the task of providing and maintaining the infrastructure, education and health care needed by modern economies.

However, on the positive side, one can see a chain reaction of events caused by population growth. Population is beneficial to an economy due to the fact that population growth is correlated to technological advancement. Rising population promotes the need for some sort of technological change in order to meet the rising demands for certain goods and services. With the increased populace, economies are blessed with a large low cost labour force due to its immense availability. An increase in labour availability and a low cost for labour results in a huge rise in employment as businesses are more inclined to the cheap labour. Low labour costs results in a shift of money usage from wages into advancement through technology. According to this model, the technological advancement that accompanies the growth of population and the expansion of population, allows for even more population to survive due to the rise in overall outputs by the business and the nation as a whole. Thus, it generates demands for goods and results in overall economic growth. The rising population provides a supply of labour and contributes to the increase in output of goods an increase in the numbers of consumers and an increase of income, expand the demand for raw materials as well as finished products. Naturally this would lead to a shortage in goods and services caused by the high demand for products and services, forcing up prices for the natural resources. The increased prices will trigger a search for new ways to satisfy the increasing demands in order to meet expectations. Sooner or later new sources and innovative substitutes will be found. The new discoveries lead to cheaper natural resources than existed before the increase in population and the demand for goods and services begin. In turn, it leaves a nation better off than if the shortages had never appeared, meaning the nation has gone through a process of economic growth and development.

However, rapidly increasing population is the most gigantic, formidable and intractable problem which the world faces today. Everybody knows that the world of today is said to be over populated. The alarming increase in the world population poses certain crucial economic, political and social problems. A country becomes over populated when its resources fail to cope with its requirements, and its natural resources are insufficient to meet the needs of the people. In 1958 world population was less than 3 billion; the income gap between rich and poor nations was about 30 to 1. Now the population has doubled and so has this gap moved to 60 to 1. Integration of populations into economic and development policies is a necessary prerequisite for development and poverty alleviation. These further reinforce achievement of population objectives as well as the improved quality of life of the population.

Scanned with CamScanner

The rising population growth has adversely affected the quality of life of the people, in geometrical progression. Hence, the thrust for improvement in quality of life, social uplift and economic development can be augmented by improving the effectiveness of population welfare program. In the presence of current alarming growth rate, even the most judicious use of country's resources cannot turn the corner in any field of socio-economic development. Only highly drastic measures can arrest geometric population growth.

Rising population also increases the level of unemployment in the country. The impact of population growth on poverty is obvious, since poorer families, especially women and marginalized groups bear the burden of a large number of children with relatively fewer resources, further adding to the spiral of poverty and deterioration in the status of women. Thus, large part of the population is constrained to live in poor housing and sanitation conditions, with lack of access to safe drinking water. In particular, the increase in poverty leads to pressure on food consumption and adversely affects caloric intakes. This adds to malnutrition in poorer families and contributes to high levels of child and maternal morbidity and mortality. Furthermore, the rapid population growth also contributes to environmental degradation and depletion of natural resources, data shows that during last three decades, developing countries with lower fertility and slower population growth have seen higher productivity, more savings and more investments. Investments in population welfare programme, education and health sectors have contributed substantially to fertility declines. Therefore, addressing high population growth should undoubtedly be Magna Carta of the overall planning perspective. The need to pursue an effective population program at all levels can neither be ignored nor exaggerated.

3. Population Picture in Pakistan

The population of Pakistan grew, on average, at a rate of 3 percent per year from 1951 until the middle of the 1980's decade. From the mid 1980's until the year 2000, the growth of the population slowed down to about 2.6 percent per year; and from 2000 to 2012, to about 2 percent per year. The reason for this slow population increase may be that the country spent a lot of time and effort to slow down the population growth. As a result of these efforts, it is a lot poorer than what is was a long time ago. If it did not make any effort to slow down its population increase, then there would actually be 49.13 million MORE people in the country than the current reports. But on the other end, they would also be a lot richer as a country. In other words, Pakistan, had it not slowed down its population increase, would actually be 52 percent richer than it is right now. Obviously, history cannot be changed, so the efforts have been switched to educating its population instead.

The current growth rate in Pakistan is close to 2%, but this is expected to halve to less than 1% by the year 2050 - at which point it is predicted to cross the 300 million thresholds. The population is predicted to near 210 million by 2020 and get to 245 million by 2030.

The reasons behind this population growth are increase in fertility rate, control of the fatal diseases, infant death rate curtailed, and lack of recreational facilities, male dominated society, early marriages, and low status of women, joint family system, illiteracy, false religious practices and polygamy.

4. Implication of Population on Socio-Economic Development

Pakistan's population has grown at an average rate of 3 per cent per annum since 1951 and until mid-1980's. Population growth slowed to an average rate of 2.6 per cent per annum during 1985-86 and until 1999-2000. However, since 2000-01 Pakistan's population is growing at an average rate of almost 2 per cent per annum. Pakistan is relatively poorer today as a result of higher population growth rate in the past. Had Pakistan's population grown at an average rate of 2 per cent per annum since 1959-60, Pakistan's per capita income would have been Rs. 64366 today as against Rs. 43748. In other words, Pakistan would have been 52.02 per cent richer than what it is today. Furthermore, Pakistan's per capita income in dollar term would have been $ 1083 rather than $ 736. Since the early 1990s, the growth rate declined to less than 4 % and population growth continued at a rate of over 2.5%, resulting in a per capita income increase of just over 1 %. With population growing at 2.1% per annum and addition of 3.1 million persons every year, Pakistan faces a formidable challenge of tackling the issue of economic development and poverty reduction. Such sizeable addition to the population not only dilutes the results of the development efforts but also creates unsustainable level of demand on already scarce resources to cater for the needs of the population. This also imposes restraints on efforts for improving the living conditions of the population. In the past, high population growth has significantly pushed the population below poverty line. If current trend persists, Pakistan's population will reach 217 million by the year 2020. Based on present growth patterns and trends, the economy would not be able to sustain the growing pressure of population and resultant deterioration in quality of life will foil government's recent efforts for social uplift. The high population growth is, therefore, a matter of national concern. Hence, the thrust for improvement in quality of life, social uplift and economic development can be augmented by improving the effectiveness of population welfare program.

Overall population has increased by 2.76 million people as compared to last year; this is still considerably high compared to the average of 0.9 per cent for the developed countries and 1.7 per cent for the developing countries. It is encouraging to note that the demographic transition has started and the growth rate is declined to 1.9 per cent. The country has to amass additional resources to feed, clothe and provide various services to population. The increasing number of population has resulted in low level of human development, low savings & investment ratios, low labour force participation rate and low per capita income. Hence, Pakistan is classified among the low-income countries.

According to one estimate, Pakistan's population will almost double in the next 32 years at the current growth rate of 1.9 per cent. Higher population growth supplies more work forces in the market and given the low economic growth in the past, it creates less jobs. Thus, it puts pressure on educational and health facilities on the one hand and gives birth to unemployment, land fragmentation, overcrowding, *katchi abadis*, poverty, crime and environmental degradation on the other.

If population slows down, demographic transition provides an opportunity for raising economic growth and increasing prosperity. Pakistan may succeed in mobilizing sufficient capital (investment) and use it efficiently with the rising working-age population but this will depend largely on government's socio-economic policies. If the workforce is better educated, it will be

Scanned with CamScanner

better placed to contribute to economic growth. If government's macro-economic policies are such that lead to job creation, the country will more likely to realize the potential benefits of demographic transition in terms of higher economic growth.

If the present trend of population growth continues, in the near future, half of the urban population would be deprived of basic facilities and civics services. The nation would face shortage of gas, drinking water, electricity, transport, sewage, disposal of solid waste, congestion and deteriorating law and order situation.

5. Recommendations for Controlling Population

The belief that Pakistan's growing population is the single factor hampering development of the country and increasing poverty is being challenged by population and development experts saying it is not population creating problems and hampering development; rather, the main concern is the quality of population. Evidence is emerging that it is poverty that is giving rise to increase in population rather than vice versa. Poor people often want more children because children represent wealth; provide household labour and the only form of social security available to parents in their old age. Majority of the people considers children as a source of income and material wellbeing. So the root cause is poverty. Government should take new steps for controlling population by;

- The religious sensitivities of the people ought to be placated with extraordinary pluck and skill. A common misconception is that family planning is something contrary to our religious beliefs and practices. In the past, our population programmes, by and large, fell to the resistance offered by semi- educated protagonists of religion having half-baked ideas. A very practical suggestion is to associate *PeshImams* of mosques, who enjoy the status of being religious cum social community leaders, with the programme for yielding quick and positive results. If they can just say a few words in favour of the programme on occasions like the *Juma* congregation, it would bring a remarkable change in the outlook and attitude of the people.
- To educate women is the most important step to control the population explosion.
- Vigorous campaign must be launched in favour of small family norm and for popularizing "Planned Family" culture in Pakistan. It must focus on breaking the myth of many sons and fallacy of large families as source of strength.
- The population education concept ought to be introduced at the intermediate and graduation levels by the Ministry of Education in order to apprise the students the disastrous consequences of unchecked population growth. Likewise, the motivational methods must be made more attractive and persuasive and necessary counselling and contraception services should be available at the doorstep. Population Planning Committee at the provincial and district levels should be activated in our country and, all the ministries and departments should be asked to assist in these programmes.
- There is an urgent need that almost all the health service outlets in the rural and urban areas of the country are provided with information, education and communication material besides adequate supply of latest contraceptives. Effective technical support should also be provided to the non-governmental organizations (NGOs) to enhance their efficiency.

- With a view to optimize the use of mass media in this regard, new strategies should be adopted and the communication wing of the ministry of population be further strengthened for implementation of family programmes. The use of radio could also be improved by frequent use of features, dramas, talk shows, jingles and more involvement of celebrities. Journalists should be invited for field visits to acquaint them about the real problems encountered in the implementation of the programme.
- Like the international population day, a national population day should also be held so that the public at large is made aware of the gravity of the situation.

6. Conclusion

Pakistan has by far the youngest population. Should such a young population be regarded as a burden or an asset? Pakistan is gifted with one of the most industrious labour forces in the world. Our demographic situation provides us with an extraordinary opportunity. We should train and educate our young to begin to fit the demographic gap that has begun to emerge in the developed world. We should convert our population problem into Nation Asset by training, educating and providing all human development facilities to our people. The thrust for improvement in quality of life, social uplift and economic development can be augmented by improving the effectiveness of population welfare programs. "Pakistan is not an over-populated country given the resource bench-mark. Growth in population could be a minor reason of poverty but not a major one. We can manage our population and within 15 years get rid of unemployment and poverty by distributing resources equitably."

CHAPTER 13

ILLITERACY IN PAKISTAN

1. INTRODUCTION

It is widely accepted that the process of education begins at birth and continues throughout life. Some believe that education begins even earlier than this, as evidenced by some parents' playing music or reading to the baby in the womb in the hope it will influence the child's development.

The word 'education' is often used to refer solely to formal education (see below). However, it covers a range of experiences, from formal learning to the building of understanding through day to day experiences. Ultimately, all that we experience serves as a form of education.

Individuals can receive informal education from a variety of sources. Family members and society have a strong influence on the informal education of the individual.

In Pakistan the number and seriousness of the problem of illiteracy naturally greater. People are sometimes unaware of the importance of education, and there is economic pressure from those parents who prioritize their children's making money in the short term over any long-term benefits of education. Recent studies on child labour and poverty have suggested, however, that when poor families reach a certain economic threshold where families are able to provide for their basic needs, parents return their children to school. This has been found to be true, once the threshold has been breached, even if the potential economic value of the children's work has increased since their return to school. Teachers are often paid less than other similar professions.

A lack of good educational institutions and a low acceptance rate for good universities is evident in countries with a relatively high population density. In some countries there are uniform, over-structured, inflexible centralized programs from a central agency that regulates all aspects of education.

- Due to globalization, increased pressure on students in curricular activities
- Removal of a certain percentage of students for improvisation of academics (usually practised in schools, after 10th grade)

2. THE FUNCTIONS OF EDUCATION

- Socialization
- Cultural innovation
- Social integration

- Knowledge transmission
- Child care for workers

3. EDUCATION AND SOCIAL INTERACTION

- Self-fulfilling prophecies

Literacy rate

Year of Census	Total	Male	Female	Urban	Rural
1951 (West Pakistan)	17.9%	21.4%	13.9%	N/A	N/A
1961 (West Pakistan)	16.9%	26.1%	6.7%	34.8%	10.6%
1972	21.7%	30.2%	11.6%	41.5%	14.3%
1981	26.2%	35.1%	16.0%	47.1%	17.3%
1998	43.92%	54.81%	32.02%	63.08%	33.64%
2018	62.3%	72.5%	51.8%	76.6%	53.3%

Literacy rate by Province

Province	Literacy rate			
	1972	1981	1998	2018
Punjab	20.7%	27.4%	46.56%	64.7%
Sindh	30.2%	31.5%	45.29%	62.2%
Khyber Pakhtunkhwa	15.5%	16.7%	35.41%	55.3%
Balochistan	10.1%	10.3%	26.6%	55.5%

4. CHALLENGES IN EDUCATION

The goal of education is the transference of ideas and skills from one person to another, or from one person to a group. Current education issues include which teaching method(s) are most effective, how to determine what knowledge should be taught, which knowledge is most relevant, and how well the pupil will retain incoming knowledge. Educators such as George Counts and Paulo Freire identified education as an inherently political process with inherently political outcomes. The challenge of identifying whose ideas are transferred and what goals they serve has always stood in the face of formal and informal education.

5. THE STATE OF EDUCATION IN PAKISTAN

- An examination of data is helpful in assessing the state of education.
  Low enrolment: There has been little change since 1993 in gross enrolment rates (GER), which increased by less than one percentage point annually between 1993 (69 per cent) and

Scanned with CamScanner

2000 (74 per cent). The government maintains that GER increased to 71 per cent from 40 per cent between 1970 and 1999; gross enrolment at the primary school level has increased from 0.77 million in 1947 to about 20 million in 2002; and 38.6 per cent of the total population is out of school and illiterate (7,785,000 primary-school-age children are out of school, and 46,702,000 adults are illiterate). UNICEF, however, maintains that there are 27 million children in the primary school age bracket (five to nine), of whom 13 million – 7 million girls -- are not enrolled. According to latest UNESCO figures, primary school enrollment for girls stand at 60 per cent as compared to 84 percent for boys. The secondary school enrollment rate stands at a lower rate of 32 percent for females and 46 per cent males. Regular school attendance for female students is estimated at 41 per cent while that for male students is 50 per cent

- **High dropout rate:** Approximately 50 per cent of enrolled children drop out before completing primary education. Of 19.5 million children currently attending primary school, only 3.9 million will reach the middle level (class VI). The dropout rate is steadily increasing, from 40 per cent in 1996-1997 to 54 per cent in 1999-2000, and is generally both higher and faster among girls. Currently, 51 per cent of boys and 59 per cent of girls leave school before reaching grade five. The only exception is Balochistan, where the male dropout rate has declined from 52 per cent to 49 per cent. According to a report in Dawn October 11, 2018, KP's school dropout rates remain high despite Rs130bn being pumped into the province's education sector in the past six years.
- **Adult Illiteracy:** According to UNESCO's EFA Global Monitoring Report 2002, Pakistan's share of the world's total adult illiterate population of 862 million in 2000 was five per cent. Its projected share of the total adult illiterate population of 799 million in 2015 is seven per cent. Its literacy rates are only higher than Nepal and Bangladesh in South Asia, and it has the lowest net primary enrolment (46 per cent) rate in the region. As of January 2019, Pakistan vows to raise literacy rate from 58% to 70% in four years by providing school access to the approximately 22.8 million students, improving the education system among all ages with modern technology.
- **Urban/rural disparities:** According to the Social Policy and Development Centre, Pakistan's urban and rural literacy rates are 63 per cent and 34 per cent, respectively.
- **Male/female disparities:** According to the EFA Global Monitoring Report 2002, Pakistan is not on track to achieve the Dakar goal of eliminating gender disparity in primary and secondary education by 2005 and in all levels of education by 2020 "unless highly focused strategies in favour of girls are implemented".

6. The Challenges in Literacy

Adult literacy has suffered primarily due to low rates of participation at the primary level, which in turn relate to poverty and lack of access. However, other causes of low literacy rates include financial constraints and ineffective/failed strategies such as:

- Resources/funds earmarked for adult literacy programmes were hardly 1% of the education budget. Furthermore, funds could not be provided on time.
- Primarily, adult literacy has suffered due to lack of political will and absence of consistency in policy. There has been wide divergence from the formal textual contents of the policy on literacy which was manifest in the absence of formal financial allocation for literacy up to the 5th Development Plan of Pakistan. Political Governments never took literacy as an important vehicle of development mainly because of their feudal and elitist mindset. It has not been given the needed/desired priority in EFA programmes. Only a few projects on adult literacy could be launched during the post Jomtien period, which had limited coverage and were restricted to not more than 10% of the target group.
- There is an absence of a strong coordination and organizational structure with the result that interaction among the principal actors in the field of adult literacy remained weak.
- The professional base of adult literacy initiatives remained under-developed due to lack of training of instructors; lack of formalized curriculum; and a virtual non-existence of effective research.
- Monitoring and evaluation mechanism at the grassroots level could not be strengthened, which adversely affected the internal efficiency and effectiveness of the literacy programmes and projects.
- Population explosion, lack of community and civil society participation; irrelevance of literacy programmes and curricula are some other challenges and issues in literacy.
- It may be mentioned that all literacy programmes in Pakistan are conducted in respective regional languages and requisite standardized material is amply available in the market.

7. Status of Education in Pakistan

- Traditionally, Pakistan's education sector has been classified broadly into three parallel systems - public or government-run schools, private schools, and ***Madrasas*** - each of which follows its own curriculum, teaching methods and examination processes. The state-run school system's inability to respond to the country's educational needs has benefited the ***Madrasas*** and private schools alike. ***Madrasas*** offer free education, boarding and lodging, providing incentives to the homeless and less privileged sectors of society, whose demand for education is weighed down by economic restraints. The private school sector has similarly benefited from the failure of the public school system, with the number of its institutions mushrooming to above 36,000 over the past two decades. Many of these institutions are driven by profit and cater to the more privileged segments of society, with tuition fees that are unaffordable to a majority of Pakistanis. The standards of education in the most privileged of them, including their use of English for instruction, is far superior to those of the public schools, which teach in a vernacular language. In effect, the private school system has created a system of educational and linguistic division. The products of the public school sector often are uncompetitive in the job market.

In Pakistan despite considerable progress made in expanding the education network since independence in 1947, the overall progress in this crucial sector cannot be termed as satisfactory. Pakistan's net primary enrolment rate is significantly below its neighbours in South Asia; net primary enrolment rate is 65 per cent in Pakistan, 75 per cent in Bangladesh, 77 per cent in India and close to 100 per cent in Sri Lanka. Significant gaps in enrolment rates exist between urban and rural areas. Rural and urban areas literacy rate is 30 per cent and 70 per cent respectively. The adult literacy rate in Pakistan is only 50 per cent (63 per cent for male and 38 per cent for females), which is the lowest in South Asia. The number of illiterate people, in fact, has increased from 28 million in 1972 to 46 million at present. While gross primary enrolment has gone up from 74 per cent in 1990 to approx. 85% in 2005, net enrolment in age group 5-9 years has hardly

Scanned with CamScanner

improved in these 15 years. One reason for the heavy drop-out rate particularly among girl students is inadequate access to schools because only two-thirds of villages have a school for girls within one km of the village centre. The level of public spending on education has regrettably declined from 2.6 per cent of the GDP in 1990 to 1.8 per cent in 2002-03. This is not only the lowest in South Asia but at the global level, only 12 countries spend less than 2 per cent of their GDP on education and Pakistan is now among them. The literacy rate is very low in Pakistan. It has declined from 60 percent to 58 percent, according to the Economic Survey of Pakistan. There are multiple factors behind this. The most important is the lack of government funding for educational institutions. In 2018-19, the government budget allocated for education was Rs 902.7 billion, which was rather low for Pakistan — a country of over 200 million people, half of whom are not above 35.

Because of these indicators, Pakistan is 150th among 175 countries in terms of UNDP's human development index 2018 i.e. among the bottom 30 countries of the world. Apart from Nepal and Pakistan, all the remaining 28 countries in low HD category are in Africa. This gap is attributable to inequality in the distribution of resources, higher teacher absenteeism, lack of access and higher opportunity cost for parents in rural areas.

Pakistan started with a very low education profile but today a lot has been achieved. Literacy rate, counted by number of people 'who could read only' in 1951, was 16% has now been calculated on the basis of those 'who are able to read with understanding and can write a short statement' is 54% in 2004. The number of primary schools increased from about 8000 in 1947 to around 180000 in 2019. Gross enrolment at this level increased from 0.77 million to about 20 million. The number of elementary/secondary schools, colleges and universities has correspondingly increased. However, there is still a lot to be done in order to make Pakistan a prosperous country. Mass dropouts at primary and secondary levels, low access of women to education, inadequate facilities in the rural areas, rapid population expansion and insufficient budgetary allocations constitute the major bottlenecks in the education sector.

The only way to address this increasing segregation is through a radical reform of the public school system. The majority of Pakistanis do not have the means to access quality private school education, and the private school system has neither the resources nor the incentive to expand to the extent that it could accommodate all Pakistani families. Moreover, it is the state's constitutional obligation to provide education to its citizens.

The challenges of the 21st Century could be faced through identifying issues, developing strategies and operational programmes in Education sector. In the absence of state support, powerful Islamist groups are undermining the reform initiatives of civil society to create a sustainable, equitable and modernised public education system that educates girls as well as boys. In addition, Public school students are confined to an outdated syllabus and are unable to compete in an increasingly competitive job market against the products of elite private schools that teach in English, follow a different curriculum and have a fee structure that is unaffordable to most families. Political appointments in the education sector, a major source of state employment, further damage public education. Provincial education departments have insufficient resources and personnel to monitor effectively and clamp down on rampant bribery and manipulation at the local level. Reforms such as the Devolution of Power Plan have done little to decentralise authority over the public education sector. Instead, it has created greater confusion and overlap of roles, so that district education officials are unable to perform even the nominal functions

delegated to them. The public school system's deteriorating infrastructure, falling educational standards and distorted educational content impact mostly, if not entirely, on Pakistan's poor, thus widening linguistic, social and economic divisions between the privileged and underprivileged and increasing ethnic and religious alienation that has led to violent protests.

Expansion of education is dependent on fiscal resources. During the last decade of the outgoing millennium however, adverse macroeconomic conditions and keen inter-sectoral (within different economic and social sectors) competition for public funds seriously impaired the government's ability to continue expanding education. At the highest policy level within the government, it is readily conceded that investment in education contributes to the accumulation of human capital, which is essential for higher incomes and sustained economic growth. Education, especially basic (primary and lower-secondary) education helps reduce poverty by increasing the productivity of the poor, by reducing fertility and improving health, and by equipping people with the skills they need to participate fully in the society. More generally, education helps strengthen civil institutions and build national capacity and good governance in the implementation of sound economic and social policies.

Literacy rate for both sexes is estimated at 54.0 percent in the current year. Literacy rates for male and female are estimated at 66.25 percent and 41.75 percent in the current year respectively and up from 56.48 percent and 32.59 percent in 1998. Under the Education Sector Reforms, the National Literacy Campaign envisages making 13.5 million people literate to enhance the literacy rate to 60% by 2006. According to Federal Ministry of Education (2018). total Literacy rate is 62.3%. Males are 72.5% while Females are 51.8% literate.

Despite this awareness, major challenges remain to increase access to education, to improve equity, to improve quality, and to commit resources for educational reform. Delays in reforming the education system to keep pace with economic structure will most likely hinder Pakistan's economic prosperity. Conversely, timely reforms can pay off in terms of economic growth and poverty reduction, as is evident from the experience of East Asian countries who have generally invested heavily in basic human capital, both male and female.

8. Main Concentrations of Illiterates

The main concentrations of illiterates in Pakistan are remote rural areas; mountainous regions such as Federally Administered Tribal Areas (FATA), Federally Administered Northern Areas (FANA), the rural areas of Balochistan province and NWFP; slum areas (Katchi Abadies) in urban areas; deserts of Sindh and Balochistan provinces and pockets of refugee population in NWFP and Balochistan provinces.

9. Pakistan's Illiterates

The illiterates of Pakistan, their characteristics and reasons/factors responsible for their illiteracy, interalia, include as follows:

i. Rural People

According to 2017 Census, two third (63.6%) population of Pakistan lives in rural areas. Some of the rural areas of the country especially remote rural areas lack basic facilities of life such as roads, education and health facilities etc. Besides, having a feudal set-up, usually rural population is not encouraged to receive education. Awareness campaigns are lacking, hence

Scanned with CamScanner

illiteracy. Resultantly, literacy rate in these areas especially of rural females is very low. Literacy rate among rural females of Balochistan and FATA is less than 10%.

ii. Poor and disadvantaged people

Illiteracy rate amongst poor people is very high. At present 35% population in Pakistan lives below the poverty line. In rural areas it even ranges between 45- 50%. Besides, because of low income, they are more interested in supplementing their family income than sending children to school. Besides, the requisite higher focus on deprived population is lacking. Poverty and high opportunity cost inhibit access to literacy and education. Hence, most of them are illiterate. Slum dwellers and inhabitants of Katchi Abadies in urban areas; people working on agricultural farms i.e. tillers of land; and household workers etc are the people who are poor and illiterate.

iii. Ethnic minorities

Illiteracy is high among ethnic minorities due to lack of access to educational facilities and services, as well as, due to their peculiar customs, traditions and taboos.

iv. Nomads and refugees

Another segment of population, mostly illiterate, is nomads and refugees. Scarcity of resources, non-availability of literacy centres and educational institutions; temporary settlements and lack of awareness regarding worth and value of education and literacy are the factors that exclude these people from literacy.

v. Handicaps and people with special needs

Most of the handicaps and people with special needs in Pakistan are illiterate, due to non-availability of literacy centres and educational institutions specially required for them. Besides, there are only a few organized efforts on the part of the public sector to provide special schools for such children both because of higher cost and sceptical return.

It is the human resources of a nation, nor its physical capital or its natural resources that ultimately determine the character and pace of its economic and social development. Human resources constitute the ultimate basis for the wealth of nations. Capital and natural resources are passive factors of production; human beings are the active agents who accumulate capital, exploit natural resources, build social, economic and political organizations and carry forward national development. A country which is unable to develop the skills and knowledge of its people and to utilize them effectively in the national economy will be unable to develop anything else. The principal institutional mechanism for developing human skills and knowledge is the formal educational system. Rapid expansion of educational opportunities is the key to national development.

10. Conclusion

The ideology of Pakistan lays down two important obligations for the government. Firstly, education will be accessible to all citizens. Secondly, it shall enable them to prepare enlightened and civilized individuals committed to the cause of Islam. These obligations are in accordance with the teachings of the Qur'an that recognizes provision of education as a right of an individual

CHAPTER 14

DRUG ABUSE IN PAKISTANI SOCIETY

1. Introduction

Man's desire to employ substances that provide pleasurable stimulation or narcotic effects upon the central nervous system has been expressed universally in ancient as well as in modern civilizations. With the passage of time, excessive indulgence, in them, came to be considered as deprived or criminal behaviour. In recent year, however, it has been recognized that heroinism and drug addiction are psychiatric and social problems which initially staggering cost to individual and society socially, psychologically and economically.

The modern age is an era of industrialization and metropolitan culture, which besides providing facilities for modern living, has given a tremendous rise to many social problems like unemployment, over population, job placement, maladjustment, economic, social and emotional insecurity, frustration etc, which in turn increase the severity of the problem of drug addiction.

The drug addiction to influence behaviour is not a new phenomenon. There is clear evidence that psycho active substances were known in almost every corner of the earth from time immemorial. They were present in primitive and traditional cultures, which moulded our own, and have been found in every environment from the scorched desert to the northern tundra, and from the jungle to plains. The ubiquity of drug use is so striking that, commented, "It must represent a basic human appetite". Weil further equated the desire to periodically alter consciousness whether by drugs "innate normal drive analogous to hunger or sexual drive".

Addiction may be caused among other things to wine, alcohol or LSD (lysergic acid diethyl amide) hemp cannabis, or opium derivatives, all or any of which decrease the efficiency and health of the user. It is also expensive to cure and rehabilitative him. In this way healthy citizen becomes a liability for the society rather than remaining an asset.

Drug abuse affects every segment of our society. Day by day more frequency and dramatic drug problems are touching the lives of individuals at all social and economic levels and public has become alarmed, heroin addiction has become a cancerous disease for which no cure has been found yet, despite the declaration of "war-on-drugs" the fact remains that the problem is on the increase. There is no controversy regarding the growing drug abuse in Pakistani society. It is an accepted fact that heroin dependence has caused great harm to Pakistani youth. disagreement exist, however the best methods for eliminating it.

Scanned with CamScanner

The supporters of the "war-on-drugs" believe that this evil is not only a health issue, it is crippling the entire society and that something must be done quickly about it. The proponent of the anti-drug campaign are most concerned about teenagers who are experimenting with addictive substances.

Till recently, however, it was practiced as a social stigma this has now become a universal phenomenon and according to available reports almost all communities are affected by it today at various degrees. Drug addiction has involved both affluent industrial state, as well as developing countries in the third world. Pakistan being one of the narcotic producing countries is naturally in the very centre of this problem.

Two questions that usually appear in one's mind are what are these drugs? And, how does a person become an addict? The researcher has tried to define and explain the terms and various other related aspects about drug and drug addiction in order to make them clearly understandable.

2. DRUG

Drug is very wider term and that can be used for both medicinal and non-medicinal purposes. Drug in context of phrases like drug problem or drug abuse is really a short hand for socially disapproved ways.

The very word "drug" means different things for different people. For some people, drugs are those substances, which are illegal and socially disapproved of associated with stereotypes images of "junkies" or solvent sniffers and not with every day substances that ordinary people use, on other hand many people increasingly refer to all medicinal preparations as drugs. One useful definition suggests that, "drug is a substance which, when introduced to the body, alters the structure or function of the organism.

Weissman has pointed out that "Drug is any substance (other than food) which by its chemical nature affects the structure or functioning of living organism".

> *According to Oxford English dictionary "A substance which when swallowed. inhaled or human body induces drowsiness, sleep and insensibility according to its potency and amount taken".*

In the *Readers Digest* dictionary, it has been defined as "one which cause euphoria in the taker and predisposes hint to addiction". The word drug is believed to have originated by mistake from a German word "drug" meaning "dry" which in common usage denotes contents. Drug is not a scientific term. Therefore it has been variously defined.

Oxford advanced Learner's dictionary defined "An illegal substance that some people smoke, inject etc to give them pleasant or exciting feelings". Ausubal defined it as "any substance that is used to modify or explore physiological systems or pathological condition in a living organism" WHO (World Health Organization) has defined "Drug as "Any substance that when taken in to the living organism may modify one or more of its functions". In the sociological literature, drug as a term, has become synonymous with illicit or socially condemned substance. In other words, it is not the substance itself, rather it is the use or the purpose and the method of its use which confers upon it the title for its classification either as a "drug" or otherwise (such as medicine).

3. DRUG ABUSE

Drug abuse is also a relative term, having different meanings for different people, non-medical or recreational use of drug is first form of abuse. However, certain medical drugs can also be abused, if applied for non-medical purposes, such as the use of amphetamines for maintaining wakefulness or the use of morphine for euphoric purposes.

Furthermore, certain drugs are used for recreational purposes in certain communities without being labelled as drug abuse, such as alcohol. In such situations use is distinguished from "abuse" with reference to the quantity of drug consumed, the method of its use, and the effect it produces.

Paul Fuqa expressed that it is difficult to define to ones complete satisfaction the term Drug abuse. Encyclopaedia Americana defines the term as "the excessive or addictive use of psychotropic substance for non-medical purposes Vogel, says "Drug abuse is used without a precise definition and may refer to different things in different circumstances" According to World Health Organization, "Drug abuse is the consumption of a drug apart from medical need or in the unnecessary quantities". Its nature and significant may be considered from two view points, one relating to the interaction between the drug abuse and the individual, the other to the interaction between the drug abuse and society. The transition from drug use to abuse in a etiological literature on drug abuse, is generally identified as excessive euphoric and continuous use of a drug leading to adverse effects on abuser as well as on society in general. Yet problems of precise determination of the "adverse" effects, remains unresolved.

The laws of various countries delegitimize the use of drugs in terms of the type of drugs, quantity consumed, method and place of use, age of the user, and motivation of the use etc.

4. DRUG ADDICTION

In ***Encyclopaedia Americana*** the term has been defined as "the compulsive use of a drug in greater amount than is used in ordinary therapeutic or is acceptable in social customs, and that is harmful to the individual or society or to both"

The term has been defined in "The New Universal Library" as "the craving for any drug which usually occurs in inadequate or abnormal personality". The underlying object of drug taking is usually the desire to with draw in to a World of Dreams and fantasies.

Ausubel define drug addiction as "continued use of the drug than is necessary to maintain normal physiological functions and discontinuance of the drug results in definite physical and mental symptoms"

5. TYPES OF DRUGS

Drugs that either depress or stimulate the central nervous system may be categorized into eight major groups:

- Opioids, including opium, morphine, codeine, heroin, methadone and mepceridine.
- Sedatives, including alcohol and anti-anxiety agents, which depress the central nervous system (CNS).
- Cocaine and amphetamine like drugs, which stimulate the central nervous system
- Cannabinoids, including both natural forms (found in marijuana) and certain synthetics

Scanned with CamScanner

- Nicotine
- Psychedelics or hallucinogen including LSD, Mesoaline and psilocybin.
- Arylcyclohery Lamines (phencyclidine and related compounds).
- Inhalants, including nitrous oxide, ether and toluene, and a miscellaneous group made up of substances contained in tea and coffee (caffeine), betel nuts, kava and other plant products.

Heroin

Heroin was discovered in 1874 but its use was limited till 1898, and by the end of 19th some of its dangers surfaced and were being recognized. Heroin is chemically treated morphine the psychotropic action that account for their abuse of addicts is desired as euphoric, a state of peculiar wellbeing. After intravenous administration of morphine and heroin the addict experiences immediate sensation of physical pleasure. Heroin is the drug probably most associated with abuse and addiction in eyes of public. Heroin and the other opiates are also called narcotics because they are used medically to relieve pain and produce sleep. These are usually taken by mouth but can be injected. The main stimulants are Amphetamines or their derivatives and cocaine a natural component of the leaves of coca plant. Other drugs of abuse include cannabis (marijuana, hashish, etc, from the hemp plant cannabis sativas, and other Hallucinogens

6. Drug Culture in Pakistan

Poppy and opium have been cultivated in northern part of Pakistan (mainly in the North West Frontier Province) for centuries. Opium was sold in licensed shops through the Indo-Pak subcontinent. At the time of independence in 1947, there were approximately 100, 000 regular and registered opium users in Pakistan mainly in lower socioeconomic groups. As a poor man's drug of recreation opium posed no serious legal or social problems.

Heroin, as a drug of use, was virtually unknown in Pakistan prior to 1979, since then, Heroin addiction has reached epidemic proportions and has affected nearly all socio-economic groups, and Pakistani society is now embroiled in a growing, complex and multifaceted narcotic menace.

Poly drug abuse

Another alarming trend that has been observed is the poly drug abuse in which a person uses more than one substance to maintain his dependence. Noticeable among these are the tranquilizers, mandrax barbiturates and other legal psychoactive substances with heroin remaining the drug of choice. This poses a major challenge to the people tackling the drug problem in Pakistani society. These drugs are usually prescribed by the medical practitioner or used as self-medicines.

7. Effects of Drug Abuse

The problem of drug abuse, particularly the heroin addiction is of grave concern, no doubt. The statistics speak out it, it is a problem of wider magnitude, deeper intensity, and varied and multiple dimensions.

The problem of drug abuse has serious implication for the health and happiness of the individual, family community and society at large. It has for reaching impacts on the economy, society, politics and even on international relations. The social functioning of the individual is

impaired due to poor health, loss of income and social isolation. The growth and developments of the family is blocked. The social environment of the community is adversely effected, eventually whole society and its proper functioning effected by drug abuse.

8. Causes of Drug Abuse

There is no single cause of drug abuse. The causes of drug abuse are manifold. It ranges from pharmacological to the environmental, social and psychological factors. Drug abuse results from a complicated interplay of these factors, which must impinge on the individual abuser at a critical time in this life cycle, any single variable in any one area of these factors is a necessary condition to initiate drug abuse but may not be sufficient in the etiology of drug abuse.

This also explains why some persons with one or more of these variables abuse drugs while other with the same variable or variables do not. As such, these variables can also be considered as predisposing or precipitating factors. Some factors make a person vulnerable to drug abuse while others indulge him in drug addiction, for example, the pharmacological properties may be the causative factors whereas the disturbed psychological states or unhappy family setup and a stimulating environment may be conducive in the initiation of drug abuse.

The causes of drug abuse and drug addiction are wide and varied. There are many reasons for the drug abuse and drug addiction. A few of them may be as follows:

1. For peace of mind
2. Because of tragic experience
3. Un-employment
4. For fun/ to seek pleasure
5. Because of bad company
6. Curiosity
7. Easy availability
8. To relieve body pain
9. Drug using peers
10. Drug using family members
11. Poor relationship with parents
12. Escapism: to forget worries
13. Lack of responsibility
14. Intra-familial stress
15. Enhancement of work performance
16. Enhancement of sex performance
17. Rebellious attitude
18. Social stress
19. Lack of medical facilities
20. Depression

Drug abuse and in particular heroin addiction has been spreading in Pakistani society at a faster rate since last seventies now it has become a serious social problem. The situation, however, has become alarming when the results of National Survey on Drug Abuse 1993 were

Scanned with CamScanner

made public. The estimated number of addicts came from 3.1 Million to 7.6 million in 2015. This turn out is an extremely high figure for a country like Pakistan. The cause for additional worries emanating from this surveys was the estimated of heroin addicts. 1.5 million (50%) of the total addicts.

In a country like Pakistan where the employed labour force is around 29 Million, the number of addicts seemed to be alarmingly high. The situation, becoming more serious due to the heroin addicts is forming a significant part. These employed can hardly afford to support the addiction habits of their near and dear ones through their income or meagre resources. Then the drugs are extremely costly as compared to the meagre earnings of majority of employed personnel.

This factor alone is indicative of the seriousness of the situation. Besides the obvious impact of addiction on health, family and social relations, the addicts will be forced to the generate income/money to purchase narcotics. In case of non-availability of funds he/she should resort to the illegal channels of money raising, which would be socially undesirable. Sociologists are getting core interest in this ever growing problem, but very few researchers have so far been done on this problem in our country. Keeping in view, the importance and research gap on the problem, the present researcher has decided to take this problem as his research topic.

9. Some Important Points

The following hypotheses have been formulated for the present study:

- The initial age when first experimenting with drugs is likely to be related with the dependency on drugs.
- Lower the age of drug abuser, higher will be desire to give up drugs.
- The level of drug dependency is likely to be related with the nature of family.
- Level of awareness about negative facts of drugs is likely to be related with the level of education.
- There is a relationship between the relationship of spouse and desire to give up drugs.
- Lower the personal income higher will be dependency on drugs.

Previous studies

A survey of previous study is very important for any research. There are the basic foundations on which the hypotheses and assumptions are made. Every researcher is supposed to formulate his/her theories, hypotheses, generalizations on certain facts which help him/her in understanding the problem of the said study. Therefore previous available literature is indispensable for the completion of any research work.

In Pakistan, awareness of the drug abuse problem has developed in 90s. In the past there was very little work done in the form of properly planned surveys or collection of statistical data on this subject.

Our study "A Survey to Explore the Major Factors Responsible for the Charas Addiction" was conducted in 1971 by Mohammad Pervaz for. He concluded that lack of education is one of the important factors leading to *charas* addiction and the problem is more common among the people of low-income group and they indulge in charas addiction because their friends do so.

A study conducted by Farzana Yasmeen, in 1974, about drug addiction in slum area of Karachi. The research universe had been selected the area of Lyari where 110 respondents were interviewed. Some conclusions of this study were:

- The addictive behaviour is required through interaction.
- It is due to poor group association that the lower age addicts have been indulged in drug abuse.
- They are introduced to drugs by their friends who were themselves already addicts.
- They have higher frequency of drug abuse than those who do not use drugs for company sake.
- They explain that they learnt how to use drugs by their associates and enjoy the pleasurable sensations which their friends.
- Drugs addicts have negative opinion about their own habit.
- As narcotics such as heroin, morphine, codeine etc. are costly and not easily available to the lower class addicts, they turn to the use of those drugs, which are locally prepared and thus are cheap and easy to access.

A survey conducted in Lahore by random sampling has shown that there are approximately 70, 000 opium addicts and commonly used drugs are: cannabis (***charas***); opiate narcotics; opium, pathadine and morphines and injections, opium smoking called "Madak", chandu-pure opium; liquid ***hashis***- latest development (***charas*** and linseed oil); mandrax. The survey found that the main consumers belong to the class of factory workers, and people who work for long hours such as rickshaw driver, taxi drivers, ***tanga*** drivers etc.

One hundred drug-addicts admitted to Government Mental Hospital, Lahore (mean stay of 22 days) were studied. Majority of these addicts were patients between 21 and 30 years at age. 24% of these had taken "***charas***" for a period of approximately five years; 14% used two or more drugs. Low social class (unskilled) seem to represent the majority. It is presumed that some people belonging to the higher social class were also addicts, but they did not get admitted to Government Mental Hospital because of the stigma that this carries among the educated. Regarding the educational standard, the drug dependents or respondents were mostly from uneducated class and unemployed category, which included various types of drivers and people of small, trade. The majority of patients had been brought to the hospital only when they became a nuisance to the community. Patients gave various reasons for taking drugs which included experimentation, escape from reality, seeking pleasure and sexual neurosis. The data shows that the majority of the addicts had sociopathic personalities. The common sources of drugs were friends/drug peddlers and "Vend" system. The drugs also became available to some patients in the hospital through their relatives who could not bear to see the agony of their locked up patients during the withdrawal phase.

This study shows that hospital admission rate of drug addicts is on the rise. As compare to other studies conducted in Lahore, shows that "Hashish" smoking is common practice among urban population and is rapidly spreading into not only poor socio-economic group but also among university students.

Mubbashar found that majority of the addicts (mostly ***Charas***s mokers) had poor relationships with their parents and belonged to disorganized families. He concluded that reasons of drug abuse are to relieve tension, to seek pleasure, to seek affiliation and the easy availability of drugs.

Scanned with CamScanner

According to Haider the important factors of drug addiction are to have experience and pleasure, influence of primary group, to maintain sexual relations satisfactory and to escape from the reality.

Habib found that opium is used to overcome distress in life and as a substitute of rejection by the family, neighbourhood and working colleagues. He further added that heroin is usually taken in the company of friends.

The causes of addiction according to Hussain are peer pressure, anxiety and tension. Nazli observed that cause to be bad peers, interfamilial conflict, frustration curiosity to enjoy, parental strictness and death of sonic dear one. According to Iqbal, the causes of drug addiction were bad peers and hopelessness. Other theoretical literature identified frustration, social isolation, escapism and depression, emotional deprivation, anxiety, academic failure, socialization and socioeconomic problem as causal factors.

Khan found that an average age of the heroin addict is 24 years and Qureshi reported the average age of an addict to be 23 years.

The psychosocial factors identified as leading to drug addiction are depression and peer association; association with social deviants, lack of goal direction, disturbed parental relationship, lack of parental supervision.

With reference to marital status, 90 percent heroin addicts were unmarried. Habib found that 03.2 percent of heroin addicts were unmarried.

It has been found that family environment strongly, contributes towards the aetiology of adolescent drug abuse. Disruption in interfamilial relationships was found to be one of the contributing factors of drug abuse. Jaffri concluded that a large number of heroin addicts had been disliked and punished mentally and physically by either parents or any other influential family members.

The NSDA reported that 76 percent of heroin abusers were introduced to the drugs by their friends as against 61 percent of the drug abusers and 43 percent of the opium abusers. A survey of opium smoking in the NWFP revealed that 54 percent of the respondents attributed their habit of drug abuse to peer influences.

Monthly income of heroin addict, according to Habib was about Rs.1000/-. Hussain indicated average income of Rs.1700/-, while the family income of heroin addict was Rs.7480/- on the average Ahmed found that 60 percent of heroin addicts were dependent on their families. He repoted that the family income of heroin addicts ranged from Rs.6000/- to Rs.10000/- Macisood responded that the majority of heroin addicts belonged to middle or upper class families. Likewise, a survey of heroin abusers in urban Punjab showed that 43.2 percent were themselves able to finance their heroin bill.

The National Survey on Drug Abuse (NASDA) reported that on average every heroin abuser was consuming heroin on twenty seven days a month and was spending about Rs.8150/- yearly on drugs which constituted 35 percent of his personal and 16 percent of his family income. The study conducted by the Social Science Research Centre of the Punjab University, Lahore found that the average daily consumption of a heroin abuse was 0.95 grams involving 37.82 percent of his personal monthly income.

Regarding the education of the addicts, Habib has point out that 66 percent of heroin addicts had education below the matriculation. Jafri found that the majority of intermediate and

graduate addicts failed to achieve any occupational career. The literacy level of heroin abusers was reportedly higher in Punjab 68 percent of the heroin addicts had more than 8 years of schooling. The proportion of the heroin abusers with better educational attainment was found relatively higher in Karachi, 24 percent had attained college and university education. Qureshi and Spielman found in a study done in Baluchistan that 63.2% of heroin addicts wee literate and I belonged to respectable occupation. Jaffii indicated that occupations of the fathers of heroin addict were mainly business, farming, government service and private service.

Another study was conducted by Mohammad Mumtaz Khan about drug trafficking at Karachi Airport. Some of the findings of the study are:

i. Poppy crop is sown in KPK in spite of the introduction of Hadd.
ii. Large quantities of heroin and opium are trafficked from Pakistan.
iii. Pakistan is one of the routes for trafficking the drug.
iv. Majority of traffickers were male, and large amount were trafficked to European countries and America.
v. Traffickers are white-collar criminals.
vi. Air staff and workers at the airport take part in trafficking.
vii. Educated people living in posh areas also indulge in the trafficking.
viii. Those having British passport can traffic easily.
ix. Opium, ***charas***, heroin and wine are smuggled from Pakistan.
x. Most of the heroin is prepared in the laboratories established in Pakistan

Nikhat Qayoom conducted a research in 1989 on "The nature of drug trafficking and abusers in Pakistan-content analysis of daily ***Dawn*** Karachi". Some results of her study are:

i. In the early years of the eighties viz. 1982 and 1984 mostly foreigners were involved in drug trafficking while in 1986, 1988 mostly Pakistanis were involved.
ii. During these early years, the highest frequency of reported cases related to Punjab while in later years, most drug trafficking cases were reported to be from Sindh.
iii. During the early years (1982, 1984) hashish and liquor were mostly recovered in reported cases, while in the later years (1986, 1988) mostly charas and heroin were recovered.
iv. Pakistan Narcotics Control Board has a negligible share in the discovery of reported cases throughout years under study.

A number of researches have been conducted on "drug issue" by various NGO's and institutions which are concerned with the use of narcotics and bio-social consequences. An important study make by Saeed Warsi of the "***Majlish Smajee Karkunan, Karachi***", disclosed that because of laxity of law enforcement agencies heroin and other drugs were easily available all over the county.

In Pakistan, the total number of drug addicts as per a UN report is 7.6 million, where 78% are male while the rest 22% are female. The number of these addicts is increasing at the rate of 40,000 per year making Pakistan one of the most drug affected countries in the world. Drug usage is increasing day by day. In Pakistan more than 800,000 people are addicted to drugs.

Scanned with CamScanner

10. SUMMARY

Drug addiction and particularly heroin addiction have become a serious problem which has affected millions of people including the youth who are supposed to be the torchbearers of the next generation. In the words of Encyclopaedia Britannica one cannot deny 'Not many countries today are drug oriented societies, but the implication of drug use are not necessarily the same for the adult already acquired some sense of identity and purpose in life; he has come to grip with the problem of love and sex; he has some degree of economic and social skills, drug use does not prevent the adult from remaining productive. The adolescent, in contrast, is apt to become ethnocentric and egocentric with drug usage: He withdraws with in his narrow drug culture and within himself, and becomes a preposterous "cop-out" at a time when more important development experiences are required. The drug experience can be very non - productive and costly in terms of the individuals' chances of becoming a fully participating adult.

The habit of opium abuse pertained mostly to old aged people while heroin became popular among the young people of society; there are four million drug addicts in Pakistan. Pakistan has probably the highest numbers of drug addicts in the world.

The gravity of drug abuse problem can be gauged from the fact that "A particular problem is the rising the number of injecting heroin abusers", further adding this risk "epidemics of blood borne diseases" and viruses such as Hepatitis and HIV (Aids). The situation becoming more serious due to the number of heroin addicts for the past ten years had been growing at an "alarming rate" of 100,000 per year .These drug addicts were directly or indirectly affecting nearly 20 million dependents or family members with psychological social, and economic repercussions.

On the other hand heroin kills hundreds of addicts every year, according to a Dawn newspaper's report as many as 800 bodies of heroin addicts were collected from the streets of the metropolis in 2002 against 375 in the previous year. According to Edhi foundation the bodies of heroin addicts did not undergo post-mortem examination as medico-legal officers (MLO's) fear that they might carry transmittable diseases due to the addicts trend of using second hand syringes; it is very difficult to ascertain the actual number of heroin addicts death for several reasons. The only source is Edhi foundation which, obviously, is not supposed to have received all victims. Quite often, severe cold wave, scorching heat, and other natural calamities take a heavy toll on addicts. Most of the heroin addicts are eventually disowned by their families. So situation is becoming more serious because the role of family in the non-clinical treatment methods is very important and family is a basic unit of a society. Heroin addicts should not be treated as "persona non grata "by his family but a heroin addict who deserves special attention of the family and the society for treatment and rehabilitation.

The problem of drug abuse with its multiple aspects is a major threat to society and is steadily trapping almost all social strata. The drug abuse and particularly use of heroin, the most lethal narcotics drug, has emerged as a critical problem with serious social, economic health psychological repercussions upon the individual, community and society.

To analysis the issue of addiction, its causes and consequences six hypotheses also can be formulated:

1. The first hypothesis infers that "the initial age when first experimenting with drugs is likely to be related with dependency on drugs "The calculated value of chi-square for this hypothesis was accepted, the degree of relationship was measured to be 0.428, it show that initial age when first experimenting with drugs has positive relationship with dependency with drugs. It can be conclude that the age when first experimenting with drugs is an important factor in dependency on drugs.
2. The second hypothesis infers "lower the age of drug, abuser, higher will be desire, to give up drugs". It can be concluded that age of drug addict is an important factor for desire to give up drugs.
3. The third hypothesis infers that "the level of drug dependency is likely to be related with nature of family. It can be concluded that nature of family plays important role in drug dependency and drug demand reduction activity.
4. The fourth hypothesis infers level of awareness about negative effects of drug is likely to be related with level of education. The degree of relationship shows level of awareness about negative effects of drug(s) has positive relationship with the level of education which is fairly insignificant.
5. The fifth hypothesis infers that "there is a relationship between relationship with spouse and desire to give up drug". It can be concluded that relationship with spouse is very important factor for the desire to give up drugs.
6. The sixth hypothesis infers "lower the personal income of drug abuser higher will be dependency on drug(s).

CHAPTER 15

UNEMPLOYMENT IN PAKISTAN

1. DEFINITION

Unemployment means lack of employment, inability to find work for which one is suitable by nature or attainments. This is a problem which exists more or less in every country.

2. UNEMPLOYMENT MONSTER - A THREAT TO THE SOCIETY

Unemployment is the mother of measureless ills. It is a poison: it pollutes the society and wrecks the political fabric of the country. It turns law-abiding and honest men into criminals and dacoits. It encourages dishonesty, patronizes corruption, glorifies falsehood, and brings into light the dark side of human character. It is difficult to expect truth, nobility and honesty from a person who cannot have two square meals a day, and who cannot provide a morsel of food or a dose of medicine to his sick wife or ailing children. He can have no sense of self-dignity for he has no sense of security. A long spell of poverty and unemployment is a great menace to the state. It creates discontent, discontent generates disaffection, disaffection breeds sedition and sedition may culminate in a revolution. It is, therefore, the first and foremost duty of a state to give employment to its citizens and keep them busy doing some work on other so that they may have no time to nourish unhealthy, disaffectionate and seditious thoughts. According to Sir W. Beveridge, it is "better to employ them on digging holes and filling them up again than not to employ them at all".

3. KINDS OF UNEMPLOYMENT

Economists have distinguished several types of unemployment, related to particular causes.

- **First, structural unemployment** is caused by changes in the industrial structure, for example, the decline in manufacturing industry or the introduction of new technologies which reduce the need for labour.
- **The second type is Cyclical unemployment**, which is caused by a tendency for the economy to go through periods of boom and recession in demand and production.
- **Third, frictional unemployment** results from people being unemployed between jobs or before they start work.
- **Finally, there is voluntary unemployment,** where people choose not to work, perhaps because wages are too low to provide an incentive.

4. THREE IMPORTANT PHASES OF UNEMPLOYMENT IN PAKISTAN

The problem of unemployment in our country has now become a national problem. It is difficult to estimate the number of people who are unemployed but not counted in the official statistics. It has affected educated classes as well as uneducated masses, machine workers as well as the tillers of the soil.

Civilian Labour force, employed and unemployed for Pakistan (million)

Year	2003-04	2005-06	2006-07	2007-08	2008-09	2009-10	2010-11	2018-19
Labour force	45.5	50.05	50.33	51.78	53.72	56.33	57.24	62.23
Employed	42	46.95	47.65	49.09	50.79	53.21	53.84	55.80
Unemployed	3.5	3.1	2.68	2.69	2.93	3.12	3.40	4.8

Broadly speaking, there are three important phases of unemployment in our country.

- The first and foremost phase of this problem is the country-wise unemployment among the educated class of people. There are thousands of matriculates and graduates in Pakistan for the absorption of which no adequate demand exists. Pale and spectre-thin these white collars pass from street to street tapping at various offices from dawn to dusk only to be told that there is no vacancy.
- The second phase of this problem is industrial unemployment. The post-war slump and decontrol, the enforcement of prohibition and heavy taxation, introduction of new mechanical processes and labour-saving devices, frequent strikes and lockouts and the cycle of recurring depressions in trade and commerce have resulted in thousands of mill and factory labourers being thrown out of employment.
- The third phase of this problem, equally serious, is agricultural unemployment. As nearly 70 per cent of our total population is dependent on agriculture, unemployment among field-workers has meant misery and hardship to thousands. Our peasants depend wholly on agriculture. They work only four or five months while the rest of the year they sit idle. Moreover, Pakistani agriculture depends upon the vagaries of monsoon. Proverbially speaking, it is a game in rains". Owing to untrustworthy seasonal rains, abnormal taxes and most of the cultivable land being in the hands of relentless ***Zamindars***, who never care to help the agriculturists, the masses live in a .state of chronic economic depression. Here society is acquisitive rather than functional. Exploitation is rampant. The labourers are poorly paid and are bled white to serve the few rich capitalists who render no service. They are sleeping partners but enjoy a lion's share of the profits.

Pakistan launched in May, 1973 an aggressive programme for providing immediate employment to educated skilled people. Our country decided to provide interim employment for those possessing technical and professional diplomas or higher qualifications. The volunteers enrolled under this scheme received a standard stipend depending on their qualification and experience. Several programmes have been planned for a partial solution of the problem of unemployment.

The unemployment problem in Pakistan has become very serious in the recent years. The economic well-being of the country depends greatly upon the solution of the problem of unemployment. Countries like England, France, U.S.A., etc. are also facing the problem of unemployment.

Scanned with CamScanner

In the communist countries like Russia and China, the problem of unemployment can be solved easily by employing all the idle population on any available job. In the constitution of Russia, work is both right and duty. It is the responsibility of the state there to provide work to the people. Side by side, it is also the duty of the citizens to do some work. It is written in their constitution that he who shall not work, neither shall he eat.

5. A GLOBAL THREAT

Unemployment is a big waste of manpower. It means that while the people are willing to work, they have no work to do.. It is a sort of forced idleness in: the absence of work. Unemployment is one of the most important reasons of poverty and backwardness in Pakistan.

The number of job-seekers on the live register of employment exchanges shows an even increasing unemployment. It is also notable that there are no employment exchanges in the rural areas to register the unemployed in the villages. In the rural areas also millions of people are either fully unemployed or semi-unemployed. About thirty percent population of Pakistan is living below the poverty line.

The reasons for regional inequalities are complex, but one explanation lies in the concentration of particular industries in particular areas. People without skills or qualifications find it more difficult to secure employment, since jobs of the vacancies which exist are for skilled workers. Related to this, manual workers are more likely to be unemployed than non-manual workers.

6. IMPACTS OF UNEMPLOYMENT

Common themes in people's accounts of unemployment are feelings of shame and uselessness. People' start to feel that they are on the scrap-heap of society and that they have' nothing to offer, or that society has no need of their talents and abilities.

Unemployment is a source of stigma and leads to feelings of inferiority complex and failure. People who are out of work also feel isolated, missing the social life at work and avoiding people out of embarrassment.

Unemployment can also have a brutalizing effect and there are examples in our daily life of people who turn to violence, racism and brutalized sexual fantasy to escape the boredom and meaninglessness of their days.

Unemployment can have a brutalizing and unhealthy effect on health. A recent survey by health visitors indicated an increasing level of sickness and depression. Stress and anxiety can cause physical ailments, as well as mental illness. There have also been a number of suicides by unemployed people. The effects of unemployment reach further than just those individuals without work. Whole families suffer from poverty and the anxiety of having a member out of work. Problems occur in a variety of situations and anxiety is expressed in different ways.

There is a tendency for people to take out feelings of frustration on people Close to them. Stress can cause family quarrels and ultimately marital breakdown. There is also the risk of violence when frustration and resentment build up.

Unemployment causes problems for communities and for society as a whole as well as for individuals and families. Communities become demoralized when a high proportion of people are out of work and no employment is available. Poverty also leads to physical deterioration of properties and empty factories or warehouses give a feeling of to an area. Commercial and shopping facilities are also affected and big super markets are reluctant to open branches in areas, where people have no money to spend.

The level of crime and vandalism in poor districts may be caused by unemployment, although this relationship is difficult to prove conclusively. Someone who 'is unemployed already need not fear losing his job. Unemployed people cannot pay large fines, although obviously they can still be fined. For some young people, there is even a feeling that being sent' to prison would not make much difference to their lives. Increased pressure on health and social services and our police means increased costs for society as a whole. The cost to society of such events is immeasurable, although direct costs of unemployment can be calculated.

Unemployment is an issue of national concern and there are initiatives and programmes put forward to alleviate the situation.

7. CAUSES OF UNEMPLOYMENT

The causes of unemployment are generally as follows:

- **Population growth**: Every census reveals rapid growth of population, both in cities and villages. In fact, population has been growing for the last twenty five years all over the world, but Pakistan is the greatest sinner in this respect. Every year thousands of new mouths are born to be fed and with this the poorer would become the standard of living and whatever progress is being made every year is eaten up by the increasing population.
- **Defective education system:** The educational system is so defective as to render the educated men unfit for useful occupations. The system of education originally devised by Macaulay in this country has proved to be a curse. It only produces clerks and no industrial education worth the name is imparted. True education means complete development of each individual's body, capacity of brain and soul. Education is Government's responsibility. The present system of education is defective and calls for complete overhaul.
- **Defects in agriculture system:** In an agricultural country like Pakistan, cultivatable land, according to its land laws, is held in tenancies and is controlled by a minority (under ***Zamindari***). It becomes too disintegrated to yield useful and profitable means of livelihood for the majority. Owing to purchase, partition, fragmentation and other reasons, small holdings impede the progress of large-scale cultivation. On account of these small holdings, modern methods of agriculture cannot be successfully carried out unless the Government to abolishes the ***Zamindari*** system.
- **Mechanization:** The developments of towns, cities and industrial centres, where many labour-saving devices are introduced for quicker mass-production, have resulted in throwing many manual workers out of employment.
- **Lack of regulations in demand & supply of employment:** In certain seasons, for want of subsidiary, occupation to' keep them engaged in other fields of activity, agriculturists have to remain idle. In addition to this majority of adult population, a farmer has no means to eke out his existence.
- The Government should ensure that at no time should the number of jobs be fewer than the number of unemployed persons. Similarly, the demand and supply of labour should also be properly regulated. Fractional unemployment will, however, have to be accepted during the period of adjustment.

Scanned with CamScanner

- **Capitalism – an instrument of unemployment:** The capitalists are also responsible for causing the problem of unemployment. Unemployment arises from a variety of causes. It is a serious problem to eliminate all causes of unemployment. There are occasional causes of unemployment. When there is a marked diminution in the quality of any view product such as cotton; fewer hands are required in the mills and factories. We may call this cause 'bad harvest'. And yet another serious cause is a strike or lockout and this is more to be deplored because such a stoppage of work is sometimes due to trivial causes.

8. REMEDIES

Here are given some remedies to get rid of Unemployment in Pakistan.

Agro-methods should be revolutionised: Pakistan has now become such a complicated economic, social and political issue that unless immediate and effective steps are taken to upset its scourge, it will eliminate law and order in the country. Half measures or actions of temporary nature will not in any way affect the situation. It is a fact that no one solution can be wholly sufficient for solving the problem of unemployment in our country.

Before the problem of disguised or semi-employment among the Pakistani peasants can be solved, methods of cultivation must undergo revolutionary changes. Irrigation facilities must be improved so that agriculture does not remain at the mercy of rains. Waste tracts of land should be brought under the plough and area under cultivation must be raised by land reclamation schemes. Use of chemical manures, better seeds, better system of crop rotation, better sowing and better drainage are some of the other measures that can be adopted. Above all, the farmers should be taught the importance of cooperation in agriculture. The utilization of co-operative devices for bringing about agricultural improvement can work wonders.

Reforms in modern system of education: In order to tackle the colossal problem of unemployment among the educated people, radical reforms in the modern system of education are needed. We have to overhaul our educational system from top to bottom in order to fit in with the changing conditions of modern life brought about by the rapid growth of science and technology. The swarm of clerks and white collar job-seekers should be permanently eliminated by a system of education, the main emphasis of which should be laid on the side of practical and useful being. Our new educational institutions should be in the nature of occupational institutes which should prepare our boys and girls for specific vocations in life. There should be the closest coordination and integration between our educational and industrial programmes. More rural universities should be established for giving practical and latest training in the art of scientific farming and agriculture to the village folks. All steps should be taken to curb down the tendency of the students to seek employment in overcrowded cities and their dislike to work in villages. They should be made to realize the dignity of labour. It is believed that if education is thus properly planned and made available to all the citizens of the state, there is no reason why unemployment cannot be combated.

Effective generation of industrial potential: Industrial development is our solitary hope to relieve us from the miseries of unemployment. There is no lack of manpower, cheap labour, raw material, and mineral resources of in our country but it is our misfortune that they are not scientifically used for the benefit of common people. If the water of many rivers that flow uselessly into oceans is used scientifically, not only new industries would be carried by the power of electricity, but also employment will be provided to many hands. We have to plan and exploit,

therefore, our industrial potentiality to the fullest extent to raise the status of the country, and to improve national income and living of the masses.

Along with industrial development there should also be development of our rural cottage industries and native handicraft. In a well-balanced economy, the two should be coordinated in a useful purpose. Today, we may encourage not only spinning and weaving but also other industries and handcrafts which are suitable for different areas having regard to the necessary raw material, labour supply and the capital resources available. It is hoped that if government makes provision for the guidance and training of rural artisans, for making raw materials available to them at cheaper rates, for better marketing facilities by periodical arrangements for holding industrial markets and exhibitions, a large number of villagers will be prevented from flocking into industrial centres in search of employment.

Change in foreign trade & policy: In order to encourage national industries and the consumption of native goods, the government should change its policy of foreign trade and commerce. Imports of foreign goods in our country should be discouraged as far as possible by imposing heavy excise duties on them. Our exports of finished goods must be facilitated at all costs to capture the markets abroad. As a result of these measures our industries would flourish and employ more skilled and unskilled workers in order to .meet the growing demand of the public for their products.

Replacement of capitalistic system by Islamic social system: Above all, the capitalistic system of our society should be replaced by the Islamic socialist pattern. The problem of unemployment is inherent in a capitalistic system because the view before the .capitalist is not of national welfare but of his personal profit. He would never consider the needs of the nation but run only those industries which are calculated to bring him the maximum of profit with the minimum of expenditure. Moreover, when a slum or depression comes in trade, he closes down his industries at a moment's notice. The result is that thousands are thrown out of jobs and are left to starve on the roadside or to live as government doles. War is the only remedy for unemployment known to that bankrupt system, but it is a remedy which is much more terrible than the disease itself. On the contrary, unemployment is altogether unknown to the socialist system like that of Russia or China for the simple reason that the capitalist with selfish aim of exploitation does not exist there. The state guarantees work, food and clothing to everyone. Industries are run for the benefit of workers themselves. Production is always planned. In Pakistan, this sort of system can be helpful and useful for those who are jobless and unemployed. We do not favour the nationalization of industries but plead for proper vigilance and check by the government.

More and more export-oriented industries should be set up to increase the pace of industrialization and create more job opportunities for the workers in order to solve the unemployment problem.

Stoppage of brain-drain: More or less, all the backward countries are suffering from the problem of brain-drain. Pakistan is also facing this problem seriously at the present movement. To earn the gratitude of their people, let every Pakistani scientist, engineer, doctor, pharmacist and technician share, the privilege of participating in the noble test of nation building. There are many young, people, who, when they do not find a paying job or suitable post follow the example of others living abroad, because the stipends in foreign countries are very attractive. Unemployment' and underemployment make such competent ones to go to foreign countries. This should be stopped and discouraged at all costs.

Scanned with CamScanner

The crises like that of the Gulfs sometimes create unemployment problem. This proble being faced by many non-Kuwaitis who have come back to their respective country as jobless unemployment has become their problem of problems. Their problem cannot be solved easily with an international effort - very special to provide the losers of jobs alternative tasks to their families and to fulfil their own requirements.

9. CONCLUSION

Concluding it can be said that one of the greatest concerns of the government at pres should be to provide gainful employment to every able-bodied citizen of Pakistan. It is constitutional obligation on the part of the government, for one of the main directive principles our constitution is that "the citizens have the right to an adequate means of livelihood". All plans and projects of national development if they do not take into account the question poverty and unemployment, are bound to be looked with disfavour by the public and end failure. To thousands of our unemployed countrymen, the National Plan can have some mean only if it gives them bread and work. Instead of asking for "'light", "more Light", they want u provide them with employment.

However, it is a happy sign that our government has begun paying some serious attenti to this question. Main industries, banks, insurance companies have already been denationalized ensure more employments and production. Various projects and Community Developme Schemes have also been carried out successfully to great extent. Nevertheless, for the full succ of the different plans and projects launched by the government, public co-operation is ve essential. The trouble in our country is that people expect the government to do everything. T man in the street wants that our government sitting in Islamabad should go on issuing orders paper and like Aladdin's Lamp great and good things should be created out of nothing. We forg that if we do not do the work, the work will not be done. This generation of ours is condemned hard labour. It is only through patient; untiring constructive labour on the part of the rulers a the ruled alike that the solution of unemployment problem in a backward country like Pakis can be overcome.

CHAPTER 16

VIOLENCE IN PAKISTANI SOCIETY

1. INTRODUCTION

Violence is the exertion of force so as to injure or abuse. The word is used broadly to describe the destructive action of natural phenomena like storms and earthquakes. More frequently the word describes forceful and intentional injury to people, and verbal and emotional abuse towards others. Warfare is large-scale organized violence carried out by one state against another, and states legitimately authorize the use of force through the police power to maintain public order and uphold the rule of law. The causes of violent attitudes and behaviour are important topics of study in psychology and sociology.

Proliferation of violence has become the most serious social problem in Pakistan today. Not a week, often not a day, goes by without some terrible act of violence shaking public confidence in the state's ability to protect citizens, and reminding us that a serious decline in civility has occurred in this country.

We should begin with five simple observations: One, apart from war and aggression as defined under international law, nine forms of violence may be identified as among the most commonly observed worldwide. The degree of their incidence differs in place and time. They are: domestic, criminal, official, ethnic, chiliastic, political (protest oriented), religious-sectarian, terrorist, and revolutionary violence. Often these forms overlap. For example, official violence can be as terroristic in nature as revolutionary and criminal violence. Officially sponsored death squads and foreign covert operations are examples. Similarly sectarian violence frequently takes terrorist forms as Pakistan has been witnessing with some frequency. And revolutionary violence nearly always involves a combination of protest, terrorism, and warfare.

Two, of these forms of violence only one, the revol itionary type is not currently in evidence in Pakistan. Typically, revolutionary violence differs from the other forms in that it seeks system change and tends to be practised in a sociologically and psychologically selective pattern. The other eight forms not only prevail in Pakistan today but have also been on the rise in the last two decades. However, one should note that conditions for revolutionary violence have been gathering in Pakistan since the start in 1980 of the internationally sponsored Jihad in Afghanistan.

There are indications that we are at the threshold of the outbreak of organised violence aimed at system change. If it does occur, it is unlikely to be selective in the manner practised earlier by the secular revolutionary movements in China, Vietnam, Cuba, or the Algerian struggle

Scanned with CamScanner

for independence. This lack of selectivity shall be ascribable to the fact that the perpetrators of revolutionary violence in Pakistan are likely to be religious and right wing organisations which have not set theoretical or practical limits on their use of violence. In the countries where Islamists have so far engaged in violence with revolutionary objectives, i.e. with the objective of system change, they have tended to be quite indiscriminate in its use. Contemporary Afghanistan, Algeria, Egypt and, increasingly, Pakistan are examples.

Three, the convergence and accentuation of multiple forms of violence, such as now existing in Pakistan, has historically signalled the decline of the state, its legitimacy, ideological moorings and institutional will and capacity to govern. Violence practising groups emerge as the weakened state's competitors. As such, in countries where the phenomenon persists the state gradually loses the attributes of authority, and anarchy ensues with power passing to a myriad of militias, warlords, and other more or less lawless and predatory groupings. On a safe-to-critical scale of 1-10, Pakistan falls, in our estimation, somewhere between six and seven among contemporary states. In other words, it is not quite there but is moving perilously toward a critical zone from where it will take the state and society generations to return to a semblance of normal existence. When the critical point of near collapse is reached, the viability of statehood depends more on external than internal factors. In recent years, this development occurred in Lebanon, Somalia, Rwanda, and Liberia.

Four, durable and efficient governing structures and mechanisms often develop when there is a timely and meaningful response to the challenges posed by the enfeeblement of state institutions, and the growth of an environment of generalised violence. A meaningful response is normally one that is based on precise understanding of the roots of the violence and character of its perpetrators. It also requires a certain taming of the repressive instincts that favour augmentation in the coercive capabilities of the state as the best way to deal with augmented terrorism and crime.

The South Asian subcontinent experienced this process in the last century of Mughal power and the early years of British state formation in India. The Mughal did not respond in a creative and contemporary fashion to the challenge, and failed. The British developed contemporary institutions and legislated with care and caution, thus laying the foundations of a state which endured for more than a century.

These considerations suggest that what Pakistan needs is a two-pronged policy pursued simultaneously: a carefully planned and methodically executed program of reform aimed at removing the root causes of the proliferation of violence in society, and improvement in the investigative, preventive and prosecutorial capabilities of security and intelligence agencies, and the administration of justice. The enactment of harsh laws such as the recently enacted anti-terrorism law, and tolerance of extra-judicial practices such as murder in custody rarely contribute to solving the problem. More frequently they blur the distinction between law and crime.

2. Culture and Violence

There are links between culture and violence in our society. In particular, between feudal culture and violence. Barring a few Pirs, the feudal order is rarely based on ideology or ascription. Nor, unlike capitalism, does it derive its strengths from a process of constant growth in productivity. What defines the feudal order above all is its mastery of violence. Its members practice it constantly, occasionally with some regard for local customs, and always with scant

respect for the law. Any Hari knows, as the Hari Commission so accurately described some seven decades ago, that violence defines the relationship between lords and peasants. Any experienced district officer will tell you that among the powerful lords of rural Sindh, Punjab, KPK, and Baluchistan it is the will and integrity of the government that makes the difference between law and lawlessness, civility and violence. The law abiding feudal is an oxymoron.

In economic terms, feudalism is now only one of many forces in our society, and certainly not the ascendant one. But, the culture it bred over the century remains. Culture almost always persists after the hegemony is weakened and gone. The tenacity with which the colonial culture has, after decolonisation, held out and tightened its grip on Pakistan and India is a case in point. The persistence of feudal and colonial cultures is defined by the failure of the post-colonial elite to spawn alternative values and styles as foundations of a new culture. This challenge, Pakistan's small and excessively consumption driven, therefore cautious and west-obsessed, intelligentsia has largely ignored. In fact, while feudalism serves as the whipping boy of Pakistan's intelligentsia, to my knowledge not one serious study exists on the nature and extent of feudal power in Pakistan, and none to my knowledge on the hegemony which feudal culture enjoys in this country. Hence, the two cultures, feudal and colonial, continue to enjoy absolute hegemony, that is to say, their norms of behaviour and values are largely those of society.

At the expense of stating the obvious, we should note that these values are the contemporary inheritance not only of a class but of society as a whole. Until such time as the state intervenes to enforce laws, and the intelligentsia actively promotes non-violent values, the culture of violence shall continue to prevail. Rather, as social change continues at a rapid pace, traditional systems of social control become progressively dysfunctional, and the state's administrative machinery continues to erode, violence shall increase in its varied forms.

Violence has traditionally occupied a central and elevated place in our cultures. There are numerous manifestations of it in our social life. We will mention only three: (i) the value we put on revenge, (ii) the violence against women which persists and has possibly increased and, (iii) our abuse of children.

Revenge is viewed by perhaps an overwhelming majority of Pakistanis as a natural sentiment. It is not merely accepted as normal in many areas of our social, political, and family life; rather, it is linked to the identity and honour of the individual, family, biraderi and tribe. Friends and relatives express solidarity when a man takes revenge while his adversaries proceed, more often than not, to avenge the avenger. To my knowledge, no annual statistics are compiled of revenge killings in Pakistan. Were it available the figure would run into the thousands.

3. Domestic Violence

Domestic Violence encompasses mental, emotional, verbal, sexual or physical abuse such as constant demeaning and humiliating remarks, threats, slapping, kicking, hitting, choking, and destroying property, economic deprivation, forced sexual activity, isolation and starvation.

There have been no comprehensive studies of domestic violence in Pakistan. The main method of gauging domestic violence in the country is by interviewing the women in the shelters, from newspaper reports, and from interviewing the doctors and police who come in contact with the victims in extreme cases. From conversations with women at social gatherings, in shelters, in prisons, in government, in the profession of law and women organized into professional and social welfare groups, it seems that abuse of women at home and wife battering in particular is

Scanned with CamScanner

very commonplace. One informal study, conducted by the Women's Ministry, concluded that, at minimum, 80% of all women in Pakistan were subjected to Domestic violence' in their lifespan in one way or other.

i. 'Public' and 'Private' violence

To see the difficulty presented in addressing the issue of domestic violence and child abuse, we have to analyze the dichotomy created between (a) public and private lives and (b) public and private violence. 'Public' life facilitates people's struggle against violence insofar as it is easier to collectively act and organize against the violence. Seeing Lives as 'private' on the other hand, disempowers people-firstly, by failing to see their problems as one shared by many others; secondly by making it impossible to organize against this problem; and thirdly by constricting horizons and limiting options. The 'private' life becomes subservient to 'public' life because the later incorporates the former (or has the tendency to) while the former is excluded from the latter's sphere of action. As far as the nature of violence is concerned, 'public' violence has been much easier to address because it is open to public scrutiny and condemnation. 'Private' violence has been traditionally protected from public exposure. Privacy stands as the main impediment to recognition of violence. Firstly, private violence is shielded from public eye (as well as other private eyes). Secondly, even if this violence and abuse of children reaches public notice, public action is deterred by non-familiarity with the setting of the violence and the conditions that led to it. And thirdly, there is a hesitation on the part of people who lead public lives to interfere in aspects of their peers' 'private' lives for fear that such meddling could jeopardize their own 'privacy'.

'Women and children have, historically, been relegated to the 'private' sphere. In addition, the home is seen as a bastion of privacy, effectively taking domestic issues out of the public eye. Domestic violence and child abuse, thus suffers a double disadvantage to recognition (being recognised) in that (a) structurally it affects private lives and (b) it takes place in a 'private' sphere. If we link recognition of domestic violence and child abuse on a continuum from 'public' to 'private' (meaning that public violence will be recognized and addressed before private violence will) and we also view the development process as moving women and children's lives along the continuum from 'private' to 'private-public' to 'public' then it should come as no surprise that studies on domestic violence and child abuse, in particular, come from developed countries because it is only in these countries that this issue has transcended the 'private' sphere to a great extent. Women and children of most developing countries are still struggling to get recognition of 'public' violence against weaker sections of society (mainly women and children) and efforts to study or systematically deal with domestic violence are a distance away. It is only by making the home 'public' to the extent of the abuse it fosters and by exposing 'private' relationships to public view that child abuse and domestic violence can be seen as a social problem.

ii. Role of religion

Pakistan is a Muslim country that purports to live by Islamic laws. However, the culture of Pakistan is not entirely shaped by ISLAM because historically the area that now forms Pakistan has been influenced by various other religions and cultures. There is no unified Pakistan culture due to variations in traditions in the four provinces and in different regions within each province. Nevertheless, on a broad scale it is possible to collectively talk about the ideology attached to the nature of the relationship in a Pakistani family. This ideology stems from, or is justified by,

Islamic thought. But this does not mean that problems faced in domestic life are determined by Islam. While Islamic ideology of the roles of sexes may lie at the base of gender relations in Pakistan, the actual position of women, as manifested by social and legal attitudes towards women, is the result of overlying pre-Islamic tribal cultural trends. For example, Honour Killings of both men and women are pre-Islamic tribal customs that are not sanctioned by Islam. The perpetrators often try to give Islamic legitimacy to pre-Islamic culture.

Ironically, some of the religious leaders try to legitimize the maltreatment of women by men in their homes by quoting Quranic verses. The most problematic Quranic text for many women is the following where Allah states: "As for those women on whose part you fear disloyalty and ill-conduct admonish them first, then refuse to share their beds, and then (as a final measure) beat them lightly. If they heed your call then do not treat them unjustly"(Q. 4: 34). At the outset it would do us well to remind ourselves that the Quran is the last document in which we can expect to stumble across apologetics of any kind. In its diversity of expression it represents the very spirit of divine freedom. It is in this spirit that the Quran addresses in the most pragmatic of ways the physical, spiritual, intellectual, emotional, psychological, and even biological natures of humankind. The verse, however, cannot be used to support narrow chauvinistic designs or to underpin notions of privileged masculine authority. Shaykh Seraj Hendricks in his article 'Authority and the Abuse of Power in Muslim Marriages' describes that this is a total misinterpretation of the Quranic text.

Islam condemns atrocities, arrogance and humiliation in the name of honour or baseless allegations. Therefore, the last Prophet Mohammed (Peace be upon him) advised all men to be fair, kind and courteous towards women. "You must treat those (women) with all kindness, "The best among you is the one who treats his family best."

4. Forms of Domestic Violence

Broad categories of domestic violence and child abuse include physical, sexual, psychological and emotional abuse. These types of violence tend to merge, and each abusive situation may involve different combinations of these types. Different classes of people may be subjected to different types of abuse. It is generally thought that victims of educated classes suffer more emotional and psychological abuse while those from feudal, tribal and lower classes are subjected to greater physical abuse. Forms of domestic violence and child abuse, other than beating, and that are common in Pakistan and that result in death or disfigurement include stove burning, acid burning and honour killing (locally known as ***Karo-kari*** murders of men and women allegedly involved in illicit relations). Forced marriages which include child marriages, ***watta-satta*** marriages, Foregoing the right of marriage by a female (***Haq Bakhshwan***) and ***swara*** (giving of women in exchange of a compromise), are forms of domestic violence that incorporate elements of physical, psychological and emotional abuse. In addition there is the sexual abuse in the home which encompasses marital rape and incest.

We will try to focus on different forms of violence and child abuse according to the intensity of the violence from battering to honour killings. We have discussed the issue from the start of a marriage. Even the beginning is so violent that the end becomes automatically tragic. Most of the figures are from independent sources and can be challenged by official authorities. We have just included them to present their viewpoint to make this discussion more impartial.

Scanned with CamScanner

i. Battering and yelling

In the context of Pakistani society, yelling is not taken as a violent action by partners in a home. Even children take it as very normal that their parents are arguing in high tones. This happens even in light modes. 'Curtain Lectures' are given in the open theatre of the home in most of the cases. But battering is not that easily digested in all strata's of society. It has deep psychological consequences. According to a survey, battered mothers are eight times more likely to hurt their children when they are being abused than when they are safe from violence. We have discussed the issue from the start of a marriage.

ii. Non-consensual sex

The greatest risk of violence for women and children comes from the male family members i.e. husbands and in the case of children from their father or stepfather. Sexual abuse of women and children includes marital rape and incest. Marital rape is not a crime in Pakistan. Unwanted sexual attacks are seen as a part of the institution of marriage and the concept of exercising sexual choice does not exist in the majority of cases. In very few cases the status of women in the home and her status in the society do empower them to exercise this right but that is exceptional even in educated classes.

iii. Stove burning

Incidents of women catching fire and burning to death while cooking on kerosene stoves is a common form of domestic violence by husbands and in-laws of the bride. This can be equated with 'Dowry deaths' in India. It is always regarded as an accident but in the majority of cases it has been observed that it has been used as a means of getting rid of unwanted female partners by their male partners and in-laws, including females.

iv. Acid attacks

It is a form of violence that takes place in the home and in the streets. In the first case the issue is domestic violence as the perpetrator is normally the husband or in-laws. In other cases the main motive is revenge. 'Private' cases of violence do not evoke the same response because there is a lingering feeling that the wife must have deserved it. HRCP opines that "acid attacks, a trend that is seen to be growing alarmingly over the past three years, continued to rise sharply in south Punjab.

v. Honour killing (Karo Kari)

Domestic Violence knows no bounds, with murder being its ugliest manifestation; a former or current partner is responsible for half of all the women murdered in England and the United States. Honour killing is where a man murders a woman of his family due to her 'immorality'- that is, her actual or perceived involvement with a man who is not her husband. Although the murderer in this can be any relative of the female but in so many cases husbands are also involved actively in this crime.

Domestic violence is not only restricted to partners in wedlock. It also includes child abuse. Some of its forms are specific to children which we will discuss now.

5. Child Abuse

Child abuse means physical, sexual and emotional abuse and neglect of a child by his/her (a) parents or (b) guardians. Generally, it is not believed that child abuse takes place by parents

who are supposed to be the guardians and architects and most loving people of children in the world. Many people believe that parents who abuse their children are mentally ill. Studies show that only 10% of people suffer mental illnesses who abuse their children. The Daily Times reported a study by a non-governmental organization, Lawyers for Human Rights and Legal Aid (LHRLA) which suggests, from a newspaper scanning over the last five years, that a 280% increase in child abuse in Pakistan has taken place.

6. Forms of Child Abuse

As we discussed above, physical abuse of children is coupled with emotional abuse. In the above discussion we have described child marriages and it is not a hidden fact that children are also sold by their parents due to economic reasons. Stories of camel jockeys as young as three years old trafficked from India and Pakistan are sufficient to shock any sane person.

i. Physical abuse

Battering is the most common form of physical abuse. This is not limited to partners only. This generates anger in the children in the family even if they are just spectators. If they are also subjected to violence by their parents, the situation is worse. It commonly includes repeated verbal abuse of a child in the form of shouting, threatening, or degrading or humiliating criticism. An interview study of 300 parents in Lahore, Pakistan found 83 per cent reporting that they used corporal punishment — mostly slaps or kicks. About three per cent reported using sticks, belts and other implements.

ii. Child marriages

Child marriages, a common practice among the poor in the rural and tribal areas by definition seem to be acts of violence against the little couple who are married off at ages as young as five or six or even before that. The reasons for these marriages may be economic (when a child is sold off in marriage), Watta-satta barter, compensation for the wrong doing of a family member (Swara), tribal custom, or simply concern for the wellbeing of the daughter and the wish to see her settled as early as possible.

iii. Emotional abuse

Other types of emotional abuse are confinement, such as shutting a child in dark closet and social isolation, such as denying the child a friend. The normal reactions to such hurts should be anger and pain; however, since children in this hurtful kind of environment, are forbidden to express their anger and since it would be unbearable to experience their pain all alone, they are compelled to suppress their feelings, repress all memory of trauma, and idealize those guilty of abuse. According to a report by the Ministry of Social Welfare, an average of 10,000 children flee their homes every year after being maltreated or tortured by their schoolteachers, parents and other family members. As per a survey by the NGOs' Coalition on Child Rights (NCCR), on the basis of data collected from eight districts in the NWFP last year, some 404 children ran away from home to escape torture by family members and teachers.

iv. Neglect

The most common form of child abuse is neglect. This emotional abuse destroys a child's self-esteem. Physical neglect involves a parent's failure to provide adequate food, clothing, shelter, or medical care to a child. It may also include inadequate supervision and a consistent

Scanned with CamScanner

failure to protect a child from hazards or dangers. Emotional neglect occurs when a parent or caretaker fails to meet a child's basic need of affection and comfort and encourages him to engage in delinquency. Another form is depriving the child of his basic right to education, either by failing to enrol a child in school or by permitting him to skip school. In middle and lower middle classes this behaviour is condoned by mothers and the father is not aware of the situation. Both do not address the issue and it often results in the child dropping out of school.

v. Discrimination

In Pakistan parents pray to God to have a boy in their home. One of the major arguments for polygamy and an increase in population is a desire to have a 'crown prince'. It is not difficult to understand in a male dominated society like Pakistan where gender inequality lies at the root of most serious crimes like honour killings.

This generates an inferiority complex in girls at home and results in the inappropriate growth of the personality of the child. It also affects the personality of boys at home, where they learn to dominate their sisters by virtue of their gender only. This is a time of shaping their behaviours. The lessons learnt from home are repeated in their whole life. This generates a reaction and anger in sensitive children which may cause their poor performance at home and in school and result in them leaving home in extreme cases.

vi. Sexual abuse

If Sexual abuse cannot be attributed directly to the parents then it definitely falls under the category of sheer neglect on their part as a failure to take care of their children allowing them to be exposed to such circumstances leading to this heinous crime. Sexual abuse of children has been defined as inappropriate sexual contact with a child, where the abused child is used as an object of sexual gratification.

Mona Koser, a sociologist, who has carried out research on child abuse, told that it was difficult for her to find accurate data because people were reluctant even to respond to introductory questions. Child abuse is on the rise because of a lack of parental attention and sex education. There is a lot of repression of sexuality so this shows up in unhealthy forms. You rarely find healthy expressions of sexuality in everyday life [in Pakistan] so sexual abuse becomes very common.

vii. Incest

Incest cases are seldom reported. The response of the public, police and courts is poor. A large number of cases are kept under the carpet. The victims are 'advised' to be silent. It involves extreme shame and dishonour for the family so the victim is pressurized from all quarters to hush up. Some NGO's note that this issue is seldom recognized by the courts as well. The judiciary gives maximum benefit to the accused in the name of 'saving' the family unit. In addition, incest usually involves the defilement of young girls which, if publicly acknowledged, would destroy their chances of marriage.

7. Some Reasons for Child Abuse

There are various reasons for abuse of children but a few are mentioned here:

1. Poverty is one main reason causing frustration and an inability of the parents to discharge their duties in an effective manner. Forced marriages, child marriages and giving away of daughters as a replacement of compromise stem from poverty. Child trafficking and bonded labour it's larger off-shoots.

2. Illiteracy is another big reason for abuse of children at home. Even educated people who are not aware of the subject keep on repeating the same cycle of violence which they have observed in their own childhood.
3. Social injustices, police tyranny, mental torture suffered by people in hospitals and district courts generate frustration in people, which makes them less caring parents.
4. Women who get married early and bear several children in a short span of time or those who are maltreated by their in-laws are most likely to abuse their own children.
5. Similarly, the ever-growing trend of violence in society and lack of appropriate laws to check domestic violence make children vulnerable to torture by their parents and other members of their family.
6. Religion is also used as a tool to justify disciplining children by parents. Obedience and respect to parents is always taken as keeping quiet for all kinds of atrocities by them.
7. Pakistan is a country situated in an area of wars for the last fifty years. Pakistan has had three wars with India and a long war in Afghanistan has been waged over the last three decades among different countries. India and China were also at war in the past. Being in one of the most dangerous battle grounds, having two nuclear neighbours, it has been in the eyeball of storms for the last five decades. There is no political stability and has been ruled by a military bureaucracy time and again. All this conflict has not allowed a sufficient peaceful time to develop a tolerant and prosperous society. This has directly affected the population and violent behaviour is common in many houses.

8. Legal Response

i. International obligations

Pakistan is bound to respond positively to implement the policies of CEDAW and the Beijing Declaration and platform of Action. In general Recommendation 19 (Para 11) of CEDAW it is clearly mentioned that "traditional attitudes by which women are regarded as subordinate to men or as having stereotype roles perpetuate widespread practices involving violence or coercion, such as family violence and abuse, forced marriage, dowry deaths, acid attacks and female circumcision". These international binding agreements and so many other directives and laws are obligatory for the states to effectively deal with the issue of violence against women.

ii. Constitutional guarantees

In the present Constitution, Article 25 in the Chapter on Fundamental Rights of the Citizens states as follows:

- All citizens are equal before law and are entitled to equal protection of law.
- There shall be no discrimination on the basis of sex alone.
- Nothing in this Article shall prevent the State from making any special provision for the protection of women and children.

Article 9: "no person shall be deprived of life or liberty except in accordance with law". Article 8: Any law, or any custom or usage having the force of law, in so far as it is inconsistent with the Fundamental Rights of citizens of Pakistan, shall, to the extent of such inconsistency, be void".

Scanned with CamScanner

iii. Provisions of the Pakistan penal code to confront domestic violence and child abuse

Domestic Violence is not treated under some specific law as a crime in Pakistan. Its different aspects are treated under different laws. As domestic violence ranges from minor injuries to causing death so all the laws related to injury and the death penalty are very crucial. It was in 1979 that Hudood Laws were enforced as part of the 'Islamization processes' of Gen Zia-ul-Haq in Pakistan. These laws included the Zina (Rape) ordinance and Qazaf (Allegation of adultery on the spouse) ordinance 1979 as well. Different categories of crimes and punishments ranging from criminal intimidation to murder are also available in the Pakistan Penal Code of 1860 but at this stage both the parties would have already decided to go their separate ways. When the parties go to a police station for registration of cases against each other then it is presumed that they are no longer in a spousall rellationship, rather it is a sign of enmity and an end of all negotiation and mediation.

iv. Family laws

Family courts are established to resolve family disputes related to divorce in different circumstances. It also decides the issues related to custody of children in case of separation between the spouses. In normal conditions, the right of divorce rests with males in Islam; however, it can be given to women at the time of solemnizing the marriage. Even after that a wife can ask for Khula (a divorce claimed by the wife) through family courts. Under Family Laws if the husband treats the wife with 'cruelty' then she can get a divorce by the intervention of the court. Courts try to mediate the issue if both parties agree; otherwise the marriage can be dissolved. Similarly, issues of child care and non-provision of proper facilities of life for the wife and children are the responsibility of the husband. If he fails to provide this, the wife can go to court for intervention. It is up to the court to decide whether she was treated with 'cruelty' or not.

In case of serious disputes, the family court judge nominates a three member committee, one from both parties i.e. husband and wife and a local responsible person to settle the issue amicable. In the light of a report submitted by this committee, the judge finalizes the case. In this way public participation is also ensured and so many cases do not result in separation or divorce. Family courts have been successful in mediation in a large number of cases. In a situation when there are no alternatives available for victims by the state or by the private sector, victims are left with no option but to compromise on the situation.

v. Convention on the rights of children

In ratifying the CRC, governments committed themselves to protecting all the rights of the child - social and economic, as well as civil and political. Under the CRC, children are not only protected from abuses of state power, but from all forms of physical or mental violence or abuse while in the care of "parents, legal guardians or any other person who has the care of the child", including schools. The CRC affirms that every child has the right to an adequate education and standard of living. It establishes the right of the child to be free from sexual abuse and exploitation and the illicit use of drugs. It commits states to protecting children from economic exploitation and work that may interfere with education or damage their health.

The CRC clearly states in Article 28-2 and Article 37 that a child must be protected against all forms of physical and mental violence while in the care of parents or anyone for that matter.

Article 37 of the CRC reads: "No child shall be subjected to torture or other cruel, inhuman or degrading treatment or punishment".

The CRC, to which Pakistan is a signatory, clearly forbids corporal punishment. The Law Ministry seems determined to push through the legislation. Parents and teachers need to be educated about the psychology of a child to curb child abuse.

vi. Child Marriages Restraint Act, 1929

Legally Child Marriages are prohibited under the Child Marriages Restraint Act, 1929 (CMRA). Although CMRA makes child marriages illegal, the punishment under this law act is minimal (one month imprisonment and/or a fine of Rupee 1000= 16$ app.) for marrying an adult person, the person who solemnizes the marriage and for the person who is the guardian/parent of the child. A conviction under this law does not serve to nullify the marriage.

vii. National commission on the status of women in Pakistan

The Government established a National Commission on the Status of Women in 2000. It has been tasked with:

- Reviewing and recommending the amendment of laws, rules and regulations that affect women's rights;
- Examining the policies for women's development and making recommendations for their effective impact and implications;
- Monitoring violence against women, especially domestic violence; and
- Collaborating with NGOs at the national and international level.

The Commission also has a complaint resolution role.

The National Commission on the Status of Women Ordinance 2000 established the Commission and set out its procedures. According to the Ordinance, the Commission shall consist of a Chairperson and between ten and twenty members appointed by the Federal Government. Members shall be from persons "of integrity and standing having substantial experience in law, legislation and knowledge and standing on socio-economic and legal problems of women". The majority of members shall be women, including one member from each Province, Azad Jammu and Kashmir, Northern Areas and at least one member from the minorities (Art. 3 (2)). At present, the commission is performing its duties well as per its constitution. Serious attention has been paid by the advisor to the Prime Minister for Woman's Welfare Issues to get the authorities to give a timely response to complaints by victims.

viii. Recent legislation

The most important step taken by the previous government is increased (33%) representation of females in representative bodies from the council level to national assemblies. This is a sea change and it is expected to bring very positive results. The advisor to the prime minister for the welfare of women's affairs, being a woman, is also pursuing these issues earnestly at all levels.

As every journey begins with the first step and that step has already been taken by introducing the domestic violence bill in one of the four provinces. Member of the Punjab Assembly, Dr. Anjum Amjad, presented the bill on domestic violence in the assembly on October

Scanned with CamScanner

14, 2003 but the MMA opposed it. With more women coming into parliament with a heavy mandate, a private bill against domestic violence had been introduced in the Punjab Assembly. All the bill needs is thorough support in terms of finance, judicial and legislature flexibility with transparent de jure accountability to curtail this injustice. The bill was not been passed then.

ix. Women's Rights/Laws

From 2012 to 2017, the Government of Punjab introduced and implemented several significant measures to counter gender-based discrimination, violence against women, and economic and social empowerment of women. Positive steps have also been taken to encourage and promote women's participation in the political process and the workforce, while education has remained a key priority for the Government of Punjab

In Punjab, women's rights are protected by the Constitution, and other legislative measures taken by the Provincial Assembly of Punjab.

9. CONFRONTING DOMESTIC VIOLENCE AND CHILD ABUSE

It is imperative to develop an integrated strategy to combat domestic violence and child abuse as both issues are connected to the same place - home. So far the issue had been handled from a gender perspective now it's time to act preventively with the support of the criminal justice system and on a long term basis from the parameters of public health as proposed by the World Health Organization. A long term strategy should be adopted to achieve the targets and in the meantime it is incumbent upon all concerned to implement a short term strategy in order to prevent further damage to individuals and society.

i. Long term strategy

- Social Development and poverty alleviation are two sides of the same coin. By improving the social conditions, peace in homes can be restored.
- Education for all is a key to resolve all basic issues in all societies; the Government should stress universal primary education. Parents should be bound to educate their children and penal sanctions should be included in law for violators.
- There should be an integrated national strategy coordinated with different departments of the judiciary, social welfare departments, law enforcement agencies and with the participation of the public to devise such plans which ensure the proper treatment of victims and provide them sufficient support to settle their disputes and improve life.
- New Legislation should be made to criminalize domestic violence and child abuse. The state should promulgate relevant laws which bind the state organs to specifically intervene in cases of domestic violence and child abuse of any nature should become a 'public issue'. Like Japan and Malaysia, an easy procedure is needed for reporting and mandatory reporting for people who are directly involved with children and women at risk.
- The State should ensure that a structural imbalance in society does not destabilize the family units. As mentioned in the constitution of Pakistan, there should be no discrimination on the basis of gender and women and children should be given equal rights and opportunities in all policies. The Ministry for Women's Development should go out of their way to monitor its programme and to ensure proper implementation of its programmes.

- Viable alternatives should be provided to victims by helping them to establish themselves and shelters should work as safe havens. These centres should be equipped with better facilities and there number should be increased.
- Perpetrators Treatment programmes should be launched. Their supervision by local elders and a report to a local committee about their behaviour should be the basis of a lenient view taken by the court of their misconduct with their partner. Chances should be given to them to improve their conduct in their home.

ii. Short term strategy

A short term strategy should be implemented until the macro level goals are achieved. It should aim at preparing the ground for meeting the goals as envisaged in the long term strategy. From state authorities to an individual, all should be committed to this action plan. The different roles of state, society and individuals are given below.

Role of state

- There is need to conduct a nationwide survey to systematically access the real situation of DV and CA. Government departments like police, health and social welfare departments should be tasked to record the cases and coordinate, regardless of any action taken by the state, in all cases. After gathering concrete data, necessary steps can be taken.
- Criminalizing domestic violence and child abuse is highly desired. Implementation of existing laws in their true spirit is highly recommended to achieve the desired results. There is a need to amend the Hudood laws as recommended by the National Commission for the Status of Women. Clauses like compounding deliberate murder and injury should be amended.
- Members of the judiciary, at the lower level, who deal with cases of domestic violence on a regular basis, should be sensitized.
- Training of police officers and a coordinated effort by the police and the Judiciary through already established Criminal Justice Committees in the districts can bring fruitful results for victims.
- NGO'S are already working in this sector and with their collaboration new horizons can be explored. This private-public venture can improve the situation. At the moment the issue is owned by NGO's only. This should be changed and the Government should collaborate with NGO's to achieve their common goals.
- Victim friendly practices (free legal aid and/or establishing more women police stations, children response centres) should be adapted by establishing legal desks in rescue centres of the police and other departments of the district government. Incentives should be given to the workers to achieve better results.

Role of society

- The importance of awareness campaigns cannot be underestimated and it is due to these raised voices that the situation is improving in Pakistan. People are more aware of the subject and in the urban classes and educated families there is a growing sense of treating the partners with care and affection, which is the basis of a happy married life.

Scanned with CamScanner

- It will be pertinent to mention here that NGO's and the Pakistani media have played a vital role in highlighting this issue and enlightening the public at large. The media can play a vital role and with the increased number of TV channels the situation is further improving. It should present programmes and talk shows which sensitize the people about domestic violence and child abuse and about ways and means to counter it.
- The role of religious leaders cannot be underestimated. They can work as a catalyst if the true dimensions of the issue are brought to their notice. It is by winning partners from all strata of society which will yield a better output.
- Community participation should be ensured and citizens, supported by government, should come forward and take up the challenge of treatment of offenders and victims under the supervision of experts. They are the ultimate losers and gainers in this situation.

Role of the individual

- Every citizen is bound to refrain from domestic violence and is responsible for his or her own behaviour and should also report to the responsible agencies any knowledge they have of potential victims i.e. in their neighbourhood or workplace.
- As mentioned in the domestic violence law in Japan, medical officers or other people giving any kind of aid to victims should also be brought into the network of early reporting as a measure to intervene by state authorities.

10. Faith and Violence

The violence of Islamism has emerged as a subject of anxious concern throughout the world, especially the Muslim world. Countries, such as Algeria and Egypt, are virtually in a state of civil war between Islamists of differing hues and secular, regrettably authoritarian governments. Among these countries, Pakistan is distinguished in several ways:

It is the original staging ground of Jihad as an international movement.

Unlike Algeria and Egypt where Sunni majorities predominate, Pakistan is a multidenominational country where the non-Sunni constitute an estimated quarter of the population. Furthermore, even the Sunni are divided by theological disputes, the one between the Barelvis and Deobandis is the primary example, which has tended to turn violent. Hence, there is a proliferation here of violence. So far we have witnessed the mutual terror of Sunni and Shia, of Sunni groups against Christians and Ahmedis, and killings across the Barelvi-Deobandi divide.

Pakistan remains Islamism's 'front-line state', so to speak. Besides War on Terror in FATA and the war in Afghanistan continues and, in multiple ways impacts on the internal developments in this country.

Pakistan's is an ideologically ambiguous polity; here, political paeans to Islam have served as the compensatory mechanism for the ruling elite's corruption, consumerism and kow-towing to the west. As a consequence, the ideologically fervent Islamist minority keeps an ideological grip on the morally insecure and ill-formed power elite. It is this phenomenon that explains the continued political clout of the extremist religious minority even as it has been all but repudiated by the electorate.

Our society is strewn with innocent victims of Islamist extremism. Yet, these tragedies have barely caused any reflection in this country, and others whose policies sowed the seeds of the so-called 'Islamic terror'. The truth is that as a world-wide movement, Jihad International Inc., is a recent phenomenon, a modern, multi-national conglomerate whose founders include the governments of USA, Pakistan, Saudi Arabia, Egypt, and Israel. It was the American sponsored anti-communist crusade in Afghanistan that revitalised, in the last quarter of the twentieth century, the notion of Jihad as the armed struggle of believers. Israel's invasions and occupation of Lebanon, the West Bank, Gaza, and Golan continue to invest it with moral meaning and give it added impetus.

By contrast, with the Afghanistan war pan-Islamism grew on a significant scale as a financial, cultural, political and military phenomenon with a worldwide network of exchange and collaboration. Myriads of institutions, madaris, Islamic universities, training camps and conference centres, came into being in Pakistan and other places. Sensing its enormous opportunity, traders in guns and drugs became linked to the phenomenon creating an informal but extraordinary cartel of vested interests in gun, gold and god.

Transnational involvement in the Jihad not only reinforced links among Islamic groupings, it also militarised the conventional religious parties. In effect, while the U.S. government and media blamed Iran as the source of organised Muslim rage, armed Islamic radicalism was actually nurtured in Zia ul Haq's Pakistan with American funding and the CIA's help.

In recent years, other conventional Islamic parties have also been militarising, thanks to their linkages with the Taliban, thanks also to their involvement in Kashmir.

In Pakistan's multi-denominational environment the proposal to construct the state, its laws, and institutions according to religious injunction was necessarily viewed as a differentiating, discriminatory agenda. Zia's Islamisation, like Z.A. Bhutto's consignment of Ahmedis to minority status, served as a framework for dividing this country and pitting its diverse people against each other. This had to be so particularly in a Muslim society. For our history is steeped in centuries of theological, often violent disputes, a point that is lost even on the current crop of politicians who have been witnesses to the pointless killing and dying of the last decade and a half.

Religious sectarian was an inevitable outcome of "Islamisation". There is first of all the simple insight that appears to have escaped several generations of politicians and soldiers of Pakistan: When a state claims a theocratic mission, it is bound to provoke conflicts over whose model shall prevail. Secondly, when religion is pushed explicitly into politics it becomes a currency of power. Anyone who can uses religion to garner support and undercut actual or potential rivals. To verify this, one may need count only the number of religion wielding newcomers in national and local politics since Zia's Islamisation began. The most virulent hate-mongers of today also belong to his era.

There are other less obvious factors at work. The most important of these may be the highly skewed relationship that exists in contemporary Muslim societies between the past and the future. Throughout history, there has existed an ironic connection between them: Those who glorify the past and seek to recreate it almost invariably fail while those who view it

Scanned with CamScanner

comprehensively and critically are able to draw on the past in meaningful and lasting ways. People who have confidence in their future approach the past with seriousness and critical reverence. They study it, try to comprehend the values, aesthetics, and styles which invested an earlier civilisation its greatness, or conversely, caused it to decline. They preserve its remains, enshrine relevant values, and draw enrichment from the images and events of the past both collectively and individually.

By contrast, peoples and governments with an uncertain sense of the future have distorted engagements with their past. They eschew lived history, shut out its lessons, shun critical inquiry into the past, neglect its remains but, at the same time, invent an imagined past, shining and glorious, upon which are super-imposed the prejudices and hatreds of our own time. The religious-political movements of South Asia and the Muslim world bear witness to this truth.

11. CONCLUSION

Violence in our society, as in most environments of accentuated violence, has multiple roots. These include (a) a culture of violence which persists while the traditional values and social processes which had limited its uses in an earlier time have been eroded by rapid and uneven social and economic changes; (b) injections of religion in politics and the theocratic promises which have had the effect of provoking sectarian divisions and demands; (c) U.S. sponsorship of an internationalised Jihad which provided the framework for proliferation of arms and sanctification of organised violence on religious grounds; (d) international and regional interests which have encouraged violent groupings to engage in proxy warfare; (e) an educational policy which breeds frustrated and ignorant armies of youth bred on literature of hate and violence; (f) a nuclear stalemate which has encouraged India and Pakistan to assume that they can support armed dissidents in each other's country without incurring the risk of a wider war; (g) decline in the will and capacity of state institutions to investigate crime and enforce laws rationally and vigorously. The challenge, in other words, is too large and complex to be met by limited and half-hearted measures of crisis management.

Domestic violence and child abuse remains one of the least legally addressed topics in Pakistan. The number of domestic violence cases is alarming and there is no concrete information or data available which can gauge the magnitude. The home is a private place and every abuse inside the four walls is considered to be out of the realm of the law. Cultural and religious beliefs are used as a cover to legitimize the maltreatment by abusers. Different interpretations of quaint injunctions are given to get social approval for battering and physical abuse of partners and children.

Domestic violence is a structural rather than causal problem, says Human Rights Watch in its report 'Crime or Custom?' on the issue of violence. 'It is the structure of the family that leads to or legitimizes the acts, emotions, or phenomenon that is identified as causes of domestic violence under the causal analysis. This family structure is a "structure that is mirrored and confirmed in the structure of society, which condones the oppression of women (and men) and tolerates male (female) violence as one of the instruments in the perpetuation of this power balance". In order to change this structure, in the words of Ms. Nathalie Kimaro, a High court judge of Tanzania, 'It is imperative for people to bring a change in their attitude (towards the issue)'.

There is a dire need to bring the abuse of partners and children by their parents and guardians out into the public and make them accountable. This daunting task can be achieved by devising an integrated strategy in society. From awareness raising plans to proper implementation of existing and new laws, all requires a political will by the government and political parties. 'The failure to uphold the fundamental rights of people guaranteed under the Constitution is at the heart of the crisis, not lack of provisions in the Pakistan Penal Code to combat domestic violence and child abuse'.

The most neglected part is treatment of offenders and protection of their rights, rehabilitation and intervention by the state and society at the intermediate stage. This process should be started as soon as possible with the active participation of social welfare organizations, departments and the public. It is time to address the issue on a war footing to save future generations in Pakistan. Neglecting the perpetrators, who are in the majority, will result in a recurrence of the problem.

CHAPTER 17

BEGGARY IN PAKISTAN

1. INTRODUCTION

Few things disrupt public life on roads and streets with more audacity than beggars chasing people for a paltry amount of money. It is becoming an increasingly common phenomenon to be interrupted, often insolently, while driving a car or on foot, by a barefoot child, a seemingly healthy woman carrying a bandaged infant, or an aging man waving a few pages of eveningers at you. They have become a big source of distraction for the public. Most of them shamelessly shock commuters in an attempt to generate maximum sympathy. They have horrific appearances or disabilities that are a convenient tool for extorting whatever little money they can, walking limping or roller-skating with amputated legs up and down a road all day. For some commuters it does arouse an element of pity, while for many of them it is no more than a sickening nuisance.

Most people, mainly women, see these beggars as more of a blessing in disguise than irritating entities. They find beggars to be the most readily available recipients of charity (or ***sadqah nikalna***) on a regular basis whenever commuting around the city. It is often their philanthropic spirit that makes them fork out money.

Though there is no doubt that many people resort to begging because of poverty, at the same time they exploit their economic condition to earn a certain level of subsistence. They employ different methods to get easy money which they can "earn" standing by the roadside. often taking shelter under a tree or sitting while the traffic signal turns green, instead of earning the same amount labouring all day under any kind of weather conditions. This is why many physically fit young men are usually seen begging on the streets.

If on the one hand the affluent see beggars as a medium to purifying (or legalize) their wealth, the beggars find this occupation the easiest way to earn a living. Hence this relationship has abetted beggary and turned it into an organized form.

Beggary has become a profession for most of those who are part of a much larger industry that recruits, trains and relocates men, women and children. Two things that drive this industry are 'shock value' and religious connotations of charity. To increase the shock value of innocent beggars the industry, run by a menacing mafia, has enough tricks up its sleeve. Acid and cigarette burns, amputation, and starvation are some of them and pose a serious threat to an individual's health. Few of them affect recruits for the rest of their lives, while others may be painful temporarily, and therefore capable of incurring maximum sympathy only for short-term purposes. The profession, of course has a host of idiosyncrasies attached to it, including glue sniffing, drug abuse (even among very young children), minor criminal tendencies, prostitution, sexual abuse and coercion.

The intermediary entity of the beggar mafia exploits both the poor and the rich taking advantage of the immense economic divide between the two in our society. Neither gains any benefits. The poor remain eternally poor and the affluent ones' money cannot reach the truly needy. In the presence of such networks in society, the public alone cannot deal with the evil.

Recently, the Punjab government has taken steps to deal with a major group of recruits for this industry, the children. The CPWB was set-up under the Punjab Destitute and Neglected Children Act, 2004. It carries out periodic rescue operations in alliance with the police squad. Over 82 operations since last December have been undertaken, based on information gathered from its pockets in civil society or open reception centres operating at strategic locations where beggar children spend time, are given temporary care and finally rescued. The bureau is given custody of the rescued children, who are then admitted to the Child Protection Institution where they live, attended school and play. Upon identification, the Child Protection Court hands over custody to their parents/guardians giving them guarantee that they will not be seen on the streets again.

Undertaking one massive operation clean-up would be almost impossible because in such an operation the mafia goes underground. It has a tight network whereby one gang instantly gets to know that a child from another gang in a far-off locality was picked up by the authorities.

The law that prohibits beggary and gives the powers to arrest to the police has existed for 46 years before the PDNCA. However, the increasing presence of beggars at shrines, on the roads, or in the markets, is proof that the police has not yet been mobilized to begin a crackdown on the mafia.

2. RESPONSE TO POVERTY & BEGGARY

Menace of growing poverty has been aggravated by the present unprecedented and unabated swelling in prices of food, oil, travelling and living expenses. Poverty has also given a quantum leap to the profession or compulsions of beggary. Beggary though existed from times immemorial, but its present ugly faces and dimensions have been, at times, giving shudder to sensitive Pakistanis. While waiting at traffic signal, if faced with barefooted kids dressed in dirty rags tapping at the car window for a piece of coin to buy bread one is caught up in a situation of serious mental dilemma. Should that kid be paid at the cost of encouraging beggary? Should he be left hungry if he/she is really in need of a piece of loaf to eat? Own philanthropic instinct invariably forces most of us that a few coins should be given to get rid of that ugly sight. It is easy for the Government to announce anti-beggary drive through police that works only as a broad brush gesture devoid of sincere commitment for addressing the core problem of poverty and rehabilitation of the street urchins/shelter less boys and girls. Basically it is a social and economic issue and must be dealt as such.

Poverty is universal. Poor people are everywhere. Even the richest States have some share of poverty and these States also at times look up to non-governmental philanthropic sources for handling the menace of poverty. It is only quantitatively proportionate that the numbers differ. Display of poverty under ugly faces of beggary becomes more pronounced if the management of the poor is poor. Is it not a sad affair that in an agricultural country with adequate indigenous resources about 80 to 90 % people are worried about the uncontrolled price hike of eatables with added agony further provoked by collateral rise in utility bills, house rents, transport fares and other daily use items? Those with poor income being unable to cope up with the instability of living cost often are perforce pushed towards the pains of poverty. It has become imperative now that by fully developing our agricultural potential and by implementing overdue land reforms self-sufficiency in agricultural produce is achieved through revolutionary measures.

Scanned with CamScanner

Four categories of people usually fall prey to poverty and each category of poor warrants separate ways and means for remedy. These categories include one, the Destitute - they are those who fall in it on account of being a neglected superannuating lot or due to abrupt loss of source of earning; second the Unemployed individuals - comprise those people where unemployment has been caused by lack of literacy, dearth of job opportunities or inadequacies of industrial/commercial activities and poor human resource development; third are the Sufferers of circumstantially cast poverty like orphans, widows and divorcees etc and the fourth category is of those who find their family's sustenance arduous in their very meagre inputs. It is the fourth category that is usually hit critically with uncontrolled price hike of living needs. The unemployment factor of poverty in the country has already shot up to critically threatening level. Absence of literacy, procrastinated decisions relating management of economy, spells of bad governance in past years, the inadequate industrial, technological and human resource development pace, all has been having fatal impact on the majority of already 'have-nots'. Increasing suicide cases have generally been taking toll of young educated poor lot. Media with un-broken frequency has been reporting these suicide cases on account of joblessness and poverty. Increase in unemployment has also occurred due to reduced economic activity as a result of energy crisis and due to downsizing campaigns launched in the early years of the current century.

From the number of beggars seen almost everywhere knocking at the doors, thronging on road crossings, swarming around parking places, streets, market places, parks and mosques as well as pestering for alms even in children parks and play grounds one could infer two deductions. One indication is the growing strength of needy and beggars by profession in the country. The other dimension it gives the presence of givers of charity at all these places. If there were none to pay there would be any to beg. Besides presence of individual philanthropists there are hundreds of welfare and philanthropic groups and organizations operating in the country.

Rather there is no dearth of philanthropists in Pakistan also. Couple of years back the Aga Khan Development Network had in a conference in Federal Capital proposed to set up a centre for philanthropy to enhance indigenous philanthropic pursuits. It should have been given serious consideration. There is definitely a need to coordinate and manage private and public philanthropic resources for poverty alleviation. Pragmatic approach towards alleviation of poverty calls for firstly to have arrangement of registration and updating at union/district level of the destitute, unemployed and of those rendered poor by changed circumstances. Secondly the long abandoned practice of having employment exchanges could be reactivated to provide a link between would be employers and the job seekers.

3. Conclusion

From welfare angle and to provide cheap food to the poor and beggars it may appear more decent to open food centres/cook houses through Public/private assistance. These centres/cookhouses could be planned in such a way that maximum number of poor could benefit through it. The funds donated from the Zakat/Bait ul Maal Fund and Philanthropic Agencies/ NGO's could be pooled for subsidizing these cook houses/ destitute centres. Retired God fearing and dedicated Government servants and the elected public representatives from union/district councils could be entrusted to manage these centres/cook houses.

CHAPTER 18

FAMILY PLANNING IN PAKISTAN

1. Introduction

Even though there is considerable demand for family planning in Pakistan, adoption has been hampered by government neglect, lack of services and misconceptions. Demographics play a large role in Pakistan's development and security since the recent change from military rule to civilian leadership. Challenges to Pakistani's well-being, opportunities for education and employment, and access to health care are escalated due to the country's continuously-growing population. The results of 2017 Census of Pakistan showed a total population of Pakistan at 212,742,631 people; a number which grows 2.0 percent annually, equalling a 3 million population growth per year. Though Pakistan's fertility rates still exceed those of neighbouring South Asian countries with a total fertility rate at 4.1 (3.3 children in urban settings and 4.5 children in rural areas) and contraception use is lower than 35 percent, approximately one-fourth of Pakistani women wish to either delay the birth of their next child or end childbearing altogether. As per UNFPA 2019, Pakistan's fertility rate is 3.8.

According to Dr. Ansar Ali Khan, an advisor of reproductive to the United Nations Population Fund in Pakistan, "A combination of factors like non-availability of services, baseless traditional beliefs and misconception play a big role." In addition, Ali Khan stated that "a fairly large number of the population believes the use of artificial contraceptives for family is against nature and also against Islam." Unlike Family, a neighboring Islamic republic, Pakistan's planning program has failed in recent years due to neglect and constant policy changes as a result of political upheaval. While 96 percent of married women were reported to know about at least one method of contraception, only half of them had ever used it.

2. History

In 1950, Pakistan's population reached 37 million people, making it the world's 13th most populous country. Though Pakistan was one of the first Asian countries to begin a family planning program with some help from international donors, fertility has declined slower than in neighbouring countries. In 2019, Pakistan had increased in world population ranking to 5th, with over 212 million people and the United Nations (UN) has projected that in 2050 it will reach around 292 million people.

Scanned with CamScanner

3. Beginnings

The Family Planning Association of Pakistan (FPAP), now called "Rahnuma", was founded in Lahore by Saeeda Waheed in 1953. Waheed, a member of the All-Pakistan Women's Association, began advocating for birth when her maid died from an attempt to abort her own pregnancy. The FPAP was unsuccessful in changing family planning policies until President and military leader Khan took interest in the problem of overpopulation in the late 1950s. Khan spoke at the FPAP's first national seminar in 1959, speaking on the 'menace over overpopulation'. Soon after the seminar, the National Board of Family Planning was established as a policy-advising body for the federal government.

Pakistani journalist/researcher Ayesha Khan has suggested various reasons for Ayub Khan's position on population control. Firstly, religion played a minor role in his government, a position that would change with Pakistan's next leader. Secondly, development ideology during Khan's time of power warned of the economic risks of high population growth rates. Thirdly, it had political utility for a military leader with no popular mandate to his leadership and in need of a development strategy. Lastly, support from international donors.

4. Family Planning Policy in the 1960s

Pakistan's first Family Planning Scheme was a part of the country's Third Five Year Plan (1965–1970).This scheme became the template for all subsequent family planning strategies. The scheme's goal was to have a vast impact in the shortest time possible, with a reduction of the birth rate from 50 to 40 per 1000 by 1970. At the onset of the program, condoms were the most available method of contraception, but by 1966 the Intrauterine Device (IUD) had replaced it has the "corner-stone" of the Scheme. It was said to be "safe, cheap, reversible," and it required "little user action."

5. Family Planning amid Political Turmoil

In 1969, Ayub Khan was overthrown by the joint action of right-wing religious parties and the left-wing Pakistan. His successor Yahya Khan did little more than watch as a civil war ripped apart East and West Pakistan in 1971.WajihuddinAhmed, the Family Planning Commissioner during Yahya Khan's rule, focused on reducing pregnancies in women "rather than meeting contraceptive targets alone" and introducing the pill to Pakistani women.

In 1971, while the country was split apart and international assistance halted due to army atrocities in Bangladesh, the Pakistan took power of the Pakistani government. Its leader, Zulfiqar Ali Bhutto, needed to gain legitimacy and popularity by taking an anti-American, anti-capitalist, and anti-Ayub Khan-stance. However, Bhutto found that he could not fund many of his socialist promises, and so allowed economic assistance from USAID. Over the 15 year span of 1964-1979, USAID "spent over $30 million on Pakistan's population programme; during 1965-75 USAID provided 40% of total programme inputs."However, due to extreme and unrealistic goals the USAID program was highly ineffective.

In 1977 Bhutto's Chief of Army Staff, General Zia ul-Haq, deposed the leader and declared martial law. Zia differed from his predecessors in that he "made the religious-right-wing his political ideology." He had used the religious lobbies and conservative middle-classes as support for his take-over. In a move looking to counter Bhutto's government and as a gesture to his

religious constituency, Zia froze the existing family planning program and banned publicity for family planning activities. Zia enforced strict laws against adultery (punishable by death),rape, intoxication, and theft. USAID funding was suspended, and Pakistan became alienated "from the Western powers that Ayub Khan had so carefully cultivated."

Near the end of Zia's era of power, family planning and population control became tied to the Ministry. Unfortunately, the program has remained fairly unchanged over the past 35 years due to implementation problems involving over-centralization, lack of coordination, and structural flaws.

6. Religious Influences

Muslim populations are incredibly diverse, varying by race, language, and degree of religious conservatism. Some populations are part of countries run by Islamic law, while others live under secular governments. In Pakistan, extremely conservative Islamic beliefs predominate in many parts of the country, in which purdah restricts women to their homes unless chaperoned by a male relative. Additionally, levels of schooling are very low in Pakistan, allowing men to have more power in decision-making.

When Ayub Khan was overthrown in 1969, religious demonstrators attempted to discredit the leader morally using the slogan "Family planning, for those who want free sex!"This ideology is still present in Pakistan, as the organized religious party opposes family planning because it is "un-Islamic". Though Pakistani couples commonly site religious regions for avoiding birth control, there is not one definitive agreement about family planning and contraception in Islam. In Pakistan, many local religious figures are supportive of family planning and have begun discussions in their communities in order to promote the health of women and children.

7. Current Contraceptive Use

Historical political strife and cultural restrictions on women constraining their empowerment have hampered implementation of family planning strategies throughout the country. Most women who say they do not want any more children or would like to wait a period of time before their next pregnancy do not have the contraceptive resources available to them in order to do so. One-fourth of married women are estimated to have an unmet need. In the 1990s, women increasingly reported to wanting fewer children, and 24 percent of recent births were reported to be unwanted or mistimed. The rate of unwanted is higher for women living in poor or rural environments; this is especially important since two-thirds of women live in rural areas. While only 22 percent of pregnant married women report to be currently using a modern method of birth control and 8 percent reported to be using a traditional method, lack of widespread contraceptive use could be due to the lack breadth of the current family planning program. The most commonly reported reasons for married women electing not to use family planning methods include the belief that fertility should be determined by God (28 percent); opposition to use by the woman, her husband, others or a perceived religious prohibition (23 percent); infertility (15 percent); and concerns about health, side effects or the cost of family planning (12 percent).

Extending beyond the reach of family planning and contraceptive methods is the issue of women's sexual and reproductive health. According to the World and Population, as of 2007, "only 16 percent of women receive at least four antenatal care visits during pregnancy, fewer than one-third of births are attended by skilled health personnel, and the maternal mortality ratio, at

Scanned with CamScanner

320 maternal deaths per 100,000 live births, remains high." According to the current estimates, the world population reached 7 billion in 2012, the world population was 7.5 billion on September 19, 2018 and the new projections indicate it will reach to 8 billion 2025.

8. CURRENT POLICY

Dating from 2002, Pakistan's current family planning policy reflects the government's concern with rising population trends and poverty. The policy's goals include reducing population growth (from 2.0 percent in 2019 to 1.3 by 2025), reducing fertility through voluntary family planning (from 4 births per woman in 2004 to 2.1 births per woman by 2025), which As per UNFPA 2019, is 3.8.

Birth control methods, failure rates, and side effects

Method	Failure rate (the number of pregnancies expected per 100 women)	Some side effects and risks
Sterilization surgery for women	Less than 1 pregnancy	• Pain • Bleeding • Complications from surgery • Ectopic (tubal) pregnancy
Sterilization implant for women (Essure)	Less than 1 pregnancy	• Pain • Ectopic (tubal) pregnancy
Sterilization surgery for men	Less than 1 pregnancy	• Pain • Bleeding • Complications from surgery
Implantable rod (Implanon)	Less than 1 pregnancy Might not work as well for women who are overweight or obese.	• Acne • Weight gain • Ovarian cysts • Mood changes • Depression • Hair loss • Headache • Upset stomach • Dizziness • Sore breasts • Changes in period • Lower interest in sex
Intrauterine device (Para Gard, Mirena)	Less than 1 pregnancy	• Cramps • Bleeding between periods • Pelvic inflammatory disease • Infertility • Tear or hole in the uterus
Shot/injection (Depo-Provera)	Less than 1 pregnancy	• Bleeding between periods • Weight gain • Sore breasts • Headaches • Bone loss with long-term use
Oral contraceptives (combination pill, or "the pill")	5 pregnancies Being overweight may increase the chance of getting pregnant while using the pill.	• Dizziness • Upset stomach • Changes in your period • Changes in mood • Weight gain • High blood pressure • Blood clots • Heart attack • Stroke • New vision problems
Oral contraceptives (continuous/extended use, or "no-period pill")	5 pregnancies Being overweight may increase the chance of getting pregnant while using the pill.	• Same as combination pill • Spotting or bleeding between periods • Hard to know if pregnant
Oral contraceptives (progestin-only pill, or "mini-pill")	5 pregnancies Being overweight may increase the chance of getting pregnant while using the pill.	• Spotting or bleeding between periods • Weight gain • Sore breasts
Skin patch (Ortho Evra)	5 pregnancies May not work as well in women weighing more than 198 pounds.	• Similar to side effects for the combination pill • Greater exposure to estrogen than with other methods
Vaginal ring (Nuva Ring)	5 pregnancies	• Similar to side effects for the combination pill • Swelling of the vagina • Irritation • Vaginal discharge
Male condom	11-16 pregnancies	• Allergic reactions
Diaphragm with spermicide	15 pregnancies	• Irritation • Allergic reactions

Scanned with CamScanner

		• Urinary tract infection • Toxic shock if left in too long
Sponge with spermicide (Today Sponge)	16-32 pregnancies	• Irritation • Allergic reactions • Hard time taking it out • Toxic shock if left in too long
Cervical cap with spermicide	17-23 pregnancies	• Irritation • Allergic reactions • Abnormal Pap smear • Toxic shock if left in too long
Female condom	20 pregnancies	• Irritation • Allergic reactions
Natural family planning (rhythm method)	25 pregnancies	• None
Spermicide alone	30 pregnancies It works best if used along with a barrier method, such as a condom.	• Irritation • Allergic reactions • Urinary tract infection
Emergency contraception ("morning-after pill," "Plan B One-Step," "Next Choice")	1 pregnancy It must be used within 72 hours of having unprotected sex. Should not be used as regular birth control; only in emergencies.	• Upset stomach • Vomiting • Lower stomach pain • Fatigue • Headache and dizziness • Irregular bleeding • Breast tenderness

The Pakistani nation is among the fastest growing nations in the world today. Since 1951, the population of Pakistan increased from 34 million to 212 million as per census 2017. This has contributed to making Pakistan the sixth most populous nation in the world. The enormity of the problem is not hard to realize since the resource generation power of the country has remained almost the same.

Effort to improve the health quality of mothers and children and reduction in the number of children per mother are some of the important developments in the various family planning programs introduced in Pakistan. The family planning policies are focusing on creating a balance between an increase in the resources and a reduction in the population so as to achieve a balance between the resources and the consumers. This is not very easily achieved. For much of the Pakistani population is living in poverty, which makes it difficult to allocate resources and creating a more prosperous outcome for the poor families. Reduction in the size of families through family planning will help in improving the quality of life and will provide better chances of education and employment for the next generations.

The family planning policy therefore, is currently set to reduce the population growth to 2.0 per cent per year. It also aims to improve awareness, understanding and acceptance among the masses regarding contraception and family planning and how it can help improve the quality of life. Since high birth rates are more of a trend among poor populations, making them understand that proper planning will improve health of the family, improve the quality of life and increase the children's education and job opportunities are essential.

There are many challenges to population planning implementation in Pakistan. In Pakistan, the cultural and religious institutions consider family planning a very wrong deed and have been fiercely resistant to this trend. The people follow this social pressure instead of considering their own health, resources and limitations. This factor is the primary reason why many areas of Pakistan are still devoid of family planning centres. Misconceptions, rumours and false propaganda about family planning practices are also among the most common reasons why there has been an extremely slow response in the Pakistani population. And this response is still negligible in poor areas where the need is most.

Women are more likely to be interested in such family planning practices than men, although the male dominated pattern of society prohibits its implementation. Women are not aware of family planning options, and even if they are not able to access these facilities. In many cases, people do know about these practices, but implementation is not possible, which fails to serve the purpose of creating awareness.

The government of Pakistan needs to invest more in family planning policies and create a more active set of physicians and health care providers who will emphasize the importance of family planning in Pakistan. The need to increase awareness and the removal of social taboos associated with family planning are also an immediate need (Hardee and Leahy, 2008).

9. METHODS OF FAMILY PLANNING

There are fundamentally two methods of Contraception or family planning.

(1) Permanent methods (2) Temporary methods

i. Permanent methods

Permanent methods include Vasectomy in males and Tubecotomy in females. All the scholars unanimously agree that permanent methods of family planning are prohibited since they involve changing human physiology.

> *Says Allah in the Qur'an: "So set you your face steadily and truly to the Faith: (Establish) Allah's handiwork according to the pattern on which He has made humankind: no change (let there be) in the work (wrought) by Allah: that is the standard Religion: but most among mankind understand not." (Al-Qur'an 30:30)*

The Prophet (PBUH) is reported to have said: "Marry the one who is loving and fertile, for I will be proud of your great numbers before the nations [i.e., on the Day of Resurrection]." (Abu Dawood Hadith no. 2050, Classed as saheeh by al-Albaani in Saheeh Abi Dawood, 1805)

ii. Temporary methods

Following are various different temporary methods.

a. **M.T.P. (Medical Termination of Pregnancy) or Abortion:** All scholars unanimously agree that M.T.P. or abortion is prohibited.

Scanned with CamScanner

Allah says in the Glorious Qur'an"...kill not your children on a plea of want; We provide sustenance for you and for them;" (Al-Qur'an 6:151)

"Kill not your children for fear of want: We shall provide sustenance for them as well as for you: verily the killing of them is a great sin." (Al-Qur'an 17:31)

However, scholars unanimously agree that any permanent method of family planning, or even abortion, can be done if the life of the mother is in danger. For e.g. if the woman is suffering from certain diseases like heart disease or has under gone multiple caesarean operations and in her case the continuation of pregnancy or another pregnancy may be detrimental to her life, then the woman can be aborted or a permanent method of family planning can be adopted to save the life of the woman.

b. **Taking birth control pills:** Almost all the scholars including Shaykh Ibn Baaz, Council of the Senior Scholars [of Saudi Arabia] agree that it is not allowed to take birth control pills (Fataawa al-Marah) because of its side effects and changes in the normal physiology.

c. **Copper-T:** A very common temporary method of family planning or contraception is Copper-T. Though it is known as 'contraception' but technically it is contra-implantation. The sperm fertilizes the ovum but the zygote formed is destroyed by the Copper-T and is prevented from being implanted on the uterine wall (mother's womb). Thus it is a very early abortion, which is prohibited in Islam.

Some "scholars" out of ignorance permit this temporary method of family planning without knowing its detail.

d. **Coitus Interruptus ('Azl):** Coitus Interruptus is permissible as long as it is performed with mutual consent of both the husband and wife since both of them have equal right to have children.

This is based on the Hadith of Jabir (RA) who said: "We used to practice ('Azl) coitus interruptus during the days when the Qur'an was being revealed".

HazratJabir added: "We used to practice coitus interruptus during the lifetime of Allah's Messenger while the Qur'an was being revealed." (SahihBukhari vol. 7, Hadith no. 136)

Shaykh al-Islam Ibn Taymiyah said:"With regard to 'azl, some of the scholars regarded it as haraam, but the view of the four imams is that it is permissible with the wife's permission. And Allah knows best." (Majmoo 'al-Fataawa, 32/110)

e. As regarding other temporary methods of family planning like condom etc., the scholars are divided whether their use is permitted or not. Allah (SWT) has provided a natural method of planning the family, which is medically known as lactation amenorrhea. After the women gives birth to a child, till she breast feeds she does not have her menstrual cycle, thus the chances of pregnancy in this period of lactation is minimal.

Allah says in the Qur'an "The mothers shall give to their offspring for two whole years..." (Al-Qur'an 2:233)

10. Reasons for Family Planning

All the various reasons for family planning can be divided into two categories:

1. Either for poverty or
2. Giving special attention to children by having fewer children.

As for those who are poor and fear that they will not be able to meet the economic expenses of the additional child, Allah has prescribed the system of zakaat. Every rich person who has the savings of more than the nisab level i.e. 85 gms of gold, should give 2.5% of his excess wealth every lunar year in charity. Those who are poor have the right to take the zakaat money.

Allah says in the Qur'an "...Kill not your children on a plea of want; We provide sustenance for you and for them;" (Al-Qur'an 6:151)

Allah also mentions in the Qur'an "Kill not your children for fear of want: We shall provide sustenance for them as well as for you: verily the killing of them is a great sin." (Al-Qur'an 17:31)

Both these verses seems to convey the same message but on scrutiny we realize that the first verse is meant for poor parents, who fear that if one more child is born in the family neither they will be able to survive nor the child, thus Allah says we provide sustenance for you and for them. In the other verse Allah says We shall provide sustenance for them and as well as for you, referring to rich parents who feel that if they have less children they can concentrate on them better and give them better education and quality life. Here Allah reverses the order and mentions first the children and then the parents.

CHAPTER 19

URBANIZATION

1. URBANIZATION: A MAJORITY IN CITIES

Urbanization is the process of a country becoming more industrialized from a previously dominate agricultural society. As of 2008, Pakistan had an urbanization of 35% and an annual rate of urbanization was a 3% change, which is estimated for 2005-2010. Many different factors play a role in the urbanization of Pakistan including a high, continuous population growth. Urbanization in Pakistan has also shown to be highly destructive because of the increased number of the population in a small area. Pakistan has the highest rate of urbanization in South Asia. According to the 2017 Population Census, 36.4 percent of the population lives in urban areas. In 1998, this figure stood at 32.5 percent. Other estimates, based on a modified definition of urban settlements, suggest that the ratio of urban to rural population could be 40.5 percent and even higher. The United Nations Population Division estimates that, by 2025, nearly half the country's population will be living in cities.

The world is undergoing the largest wave of urban growth in history. In 2008, for the first time in history, more than half of the world's population will be living in towns and cities. By 2030 this number will swell to almost 5 billion, with urban growth concentrated in Africa and Asia. While mega-cities have captured much public attention, most of the new growth will occur in smaller towns and cities, which have fewer resources to respond to the magnitude of the change.

In principle, cities offer a more favourable setting for the resolution of social and environmental problems than rural areas. Cities generate jobs and income. With good governance, they can deliver education, health care and other services more efficiently than less densely settled areas simply because of their advantages of scale and proximity. .

Cities also present opportunities for social mobilization and women's empowerment. And the density of urban life can relieve pressure on natural habitats and areas of biodiversity. The challenge for the next few decades is learning how to exploit the possibilities urbanization offers. The future of humanity depends on it.

Urbanization refers to a process in which an increasing proportion of an entire population lives in cities and the suburbs of cities. Historically, it has been closely connected with industrialization. When more and more inanimate sources of energy were used to enhance human productivity (industrialization), surpluses increased in both agriculture and industry. Larger and

larger proportions of a population could live in cities. Economic forces were such that cities became the ideal places to locate factories and their workers.

Cities growing as people move from the countryside in search of better jobs and living conditions.

Cities, large and small, are at the heart of a fast changing global economy—they are a cause of, and a response to world economic growth.

The world's cities are growing because people are moving from rural areas in search of jobs, opportunities to improve their lives and create a better future for their children.

This is the first time in human history that the majority of the world's population lives in urban areas.

- 3.3 billion People—more than half the world's population—live in cities.
- 60% of all people will live in cities by 2030. (In 1800, only 2% of people lived in cities and towns. In 1950, only 30% of the world population was urban.)
- Almost 180,000 people move into cities each day.
- 60 million people move into cities each year in developing countries. This rate of movement will continue for the next 30 years
- Over the next 15 to 20 years, many cities in Africa and Asia will double in size.
- City populations are growing faster than city infrastructure can adapt.
- Many urban areas are growing because their rural hinterlands are depressed, which forces impoverished rural people to move to the cities in search of work.
- These newcomers often end up not finding the opportunities they are looking for, but become part of the urban poor. Upon arrival to the city, they often encounter:
- **Lack of housing:** To make up for the lack of available homes, newcomers often set up shelters on city outskirts, usually on public owned land. This land tends to be dangerous and inhabitable, such as flood plains, river banks, and steep slopes or reclaimed land.
- **Lack of infrastructure services:** Slum dwellers often live without electricity, running water, a sewerage system, roads and other urban services.
- **Lack of property rights:** As illegal or unrecognized residents, slum dwellers have no property rights to the land they inhabit, which make it impossible for them to use land as collateral.
- Over the last 50 years the global population living in slums has risen from 35 million to over 1 billion people. This number is expected to keep rising.
- Slum dwellers make up the majority of the urban population in Africa and South Asia. The urban population of developing countries is expected to reach 50% in 2020.
- People living in slums are at particular risk to disease: On top of dealing with pollution from dirty cooking fuels, primitive stoves, and poor access to water and sanitation, they are exposed to modern environmental hazards, such as urban air pollution, exhaust fumes and industrial pollution.
- Also, as cities grow so do environmental problems:
- **Air quality worsens** in cities. Each year 1 million people die from urban air pollution.

Scanned with CamScanner

- **Traffic increases**, leading to more congestion and more road accidents. 1.2 million People die and as many as 50 million are injured in urban traffic accidents in developing countries each year, according to the World Health Organization. Victims are mostly poor pedestrians and bicyclists. Those who survive are often left disabled. For example, in Bangladesh, it is reported that nearly 50% of hospital beds are occupied by road-accident victims.

2. What is the International Community Doing?

According to Jeffrey D. Sachs, director of the Earth Institute at Columbia University, the world's cities will have to succeed on three policy dimensions to ensure all citizens have adequate living conditions:

- Urban planning, such as carefully laying out water, sanitation, transport and public health systems
- Urban development strategy, through tailoring their goals to their circumstances of their own regions
- Urban governance
- Local policy makers and international development experts are thinking about these questions: "Where will these new urban residents live? Which land should they use? Which schools will their children go to? Where will they get their water? How will their rubbish be collected? Where should they vote? Who will protect them?"
- International agencies are also working with poor countries to:
- Build adequate infrastructure, such as roads, houses, electricity, water and sanitation services, public transportation, schools and health clinics
- Transform slums into legitimate communities
- Strengthen urban governance
- Improve the lives of poor people and promote equity

i. The pace and scale of urbanization

Urban growth, which is mostly due to natural increase, is inevitable. However, the speed and size of the growth are not fixed, and vary widely among regions. The most effective way to slow rates of urban growth is to reduce unwanted fertility in both rural and urban areas. Lowering poverty, empowering women and providing quality reproductive health services all influence fertility preferences and ability to meet them.

Fertility rates are lower in urban than in rural areas throughout the world. However, the fact those large percentages of people in many developing countries are young means that urban population growth will continue rapidly for years to come. Moreover, impoverished urban women are significantly less likely than their more affluent counterparts to have access to reproductive health or contraception. Not surprisingly, they have higher fertility rates.

Migration is a significant contributor to urbanization, as people move in search of social and economic opportunity. Environmental degradation and conflict may drive people off the land. Often people who leave the countryside to find better lives in the city have no choice but to settle in shantytowns and slums, where they lack access to decent housing and sanitation, health care and education—in effect, trading in rural for urban poverty.

ii. Urbanization of poverty

Poverty is now growing faster in urban than in rural areas. One billion people live in urban slums, which are typically overcrowded, polluted and dangerous, and lack basic services such as clean water and sanitation.

Although urbanization increasingly concentrates poverty, it also provides possibilities for escaping it. For the most part, rich countries are already urbanized, and most of the expected urban growth will occur in less-developed regions, which have fewer resources for coping with the scale of the change.

In the Millennium Declaration, the international community recognized that to halve by 2015 the proportion of people living in extreme poverty, it will have to directly address the needs of the burgeoning population of poor people living in cities. One of the targets set by world leaders in 2000 was to improve significantly the lives of at least 100 million slum dwellers by 2020. Addressing the housing needs of the urban poor will be critical. A roof and an address in a habitable area are the first step to a better life. Improving access to basic social and health services, including reproductive health care, for poor people in urban slums is also critical to breaking the cycle of poverty.

3. Causes of Urbanization

People move into cities to seek economic opportunities. In rural areas, often on small family farms, it is difficult to improve one's standard of living beyond basic sustenance. Farm living is dependent on unpredictable environmental conditions, and in times of drought, flood or pestilence, survival becomes extremely problematic.

Cities, in contrast, are known to be places where money and wealth are centralized. Cities are where fortunes are made and where social mobility is possible. Businesses, which generate jobs and capital, are usually located in urban areas. Whether the source is trade or tourism, it is also through the cities that foreign money flows into a country. It is easy to see why someone living on a farm might wish to take their chance moving to the city and trying to make enough money to send back home to their struggling family.

These conditions are heightened during times of change from a pre-industrial society to an industrial one. It is at this time that many new commercial enterprises are made possible, thus creating new jobs in cities. It is also a result of industrialization that farms become more mechanized, putting many laborers out of work.

4. Effects of Urbanization

While it is true that opportunities exist in cities, it is also true that the competition for these opportunities is fierce. Very few people make their fortunes, and the rest must still find ways to eat and sleep while they wait for their chance. This leads to one of the most obvious effects of urbanization – the growth of slums.

With such rapid population growth in such urban areas as cities and towns, there are unfortunate results including:

- Declining environmental quality.
- Quality of live decreased
- Waste disposal issues

Scanned with CamScanner

- Traffic congestion
- Overcrowding in schools and hospitals
- High rates of unemployment and crime.

The State either has divested from, or is no longer able to offer, reliable mass transit, good quality and affordable primary education, and healthcare. This has lead to competition from private companies to invest and provide for the Pakistan people, however, at a very high cost which few can afford.

In 2007, the United Nations revealed that at least 50 percent of the world's population is living in cities. By 2030, that number will jump to 60 percent, with nearly 2 billion new city residents, many migrating from rural areas. According to the report, humans are building the equivalent of a city the size of Vancouver every week. While most of the growth is occurring in developing countries like China, India and Africa, ecologically rich areas such as coasts and islands are also at risk.

Kareiva and the study's lead author Robert McDonald, applied scientist at The Nature Conservancy, built scenarios of urban growth and examined how, at the current pace of urbanization, natural resources and ecosystems could by 2030 be severely damaged. Their findings include:

- Natural areas most affected by urban growth contain some of the highest concentrations of endemic species in the world — these places tend to be small, but significant. For example the Wimmer's Shrew, found only in the outskirts of the capitol of Cote D'Ivoire on Africa's west coast, is unlikely to survive the expansion of Abidjan without some help from conservation.
- 8 percent of vertebrae species have been labelled as "endangered" due to the effects of rapid urban development, and that number may continue to rise with new urban expansion and growth.
- In some regions, the proximity between protected areas and cities will greatly increase. For example, in Eastern Asia the average distance from a city to a protected area will be 14 miles by 2030, as compared to 27 miles in 1995. Such proximity will increase the pressures on natural resources and increase the likelihood of resource extraction and other threats to these protected places.

"While the effects of urbanization can be localized, cumulatively, they pose a big threat to biodiversity," said McDonald. "Our urban footprint covers much of the globe and is coming closer to stomping out many endangered species and posing new risks to protected areas and parks."

Economic concerns will also emerge with rapid urban growth. For example, accidental or intentionally started fires will increase, costing additional dollars and resources to suppress the flames that threaten homes, businesses and buildings. At Tijuca National Park near Rio de Janeiro, Brazil, there are around 75 wildfires a year, almost all caused by humans and most started at the edge of the park by surrounding residents. Water quality is also becoming a grave concern, as urban areas pose significant threats to the health of freshwater systems. For example, in Donana National Park in Spain, rivers are affected by polluted water coming from Sevilla located 30 miles upstream.

Fortunately, there is hope for turning back this tide of destruction, say the report's authors.

Governments, city-planners and conservationists can work together to predict and plan in advance for urbanization's threats to nature. Having information on cities' impacts to these endangered species and protected areas enables planners to shape the growth of cities before it's too late, and to implement more sustainable urban planning.

However, a lack of funding, especially in developing countries, may prevent the implementation of smart-growth plans and expanded public transit systems — paving the way for more vehicles and drivers contributing more greenhouse gases to the atmosphere, a major cause of climate change.

5. BENEFITS OF URBANIZATION

From the above, the growth of cities sounds rather grim. Why should such a destructive process be allowed to continue? One should not, however, be misled. There are many benefits to cities as well.

Efficiency – Cities can be tremendously efficient. For example, imagine 100 families living in 100 separate houses spread out over many acres of land. Now imagine the same 100 families in a single block of flats. Obviously, in the flats, far less effort is required to supply energy, water, heating, and waste disposal to these families. Additionally, only in cities are such things as recycling programmers possible, because collection can be made so efficient.

Convenience – In a city, everything is nearby. Access to education, health, social services and cultural events is much more readily available in a city than in a rural setting. Because things are located so closely, cities can make motor vehicle use unnecessary for many citizens. This is especially true when a city has efficient mass transportation systems in place, systems which are not feasible for rural populations.

Concentration of Resources – Because of the density of people, wealth, and other resources in cities, many institutions become possible that would not be in areas where such things are more spread out. Basically, when enough people are put together in a small area, they start coming up with ideas to do things – cultural, political, commercial and social activities that just don't occur outside of cities. For example, without cities, there never would have been universities.

6. PROBLEM OF URBANIZATION

The big cities are full of congestion and environmental pollution. The modern cities are growing in a very unsystematic manner due to fast industrialization. In reality, the concentration of industries also causes, the problems of urbanization.

The population of big cities is always on the increase, because the villagers migrate in large numbers to the cities in search of employment. In the villages there are not many opportunities to get work due to lack of industries. The people of villages also come to the cities in search of higher standard of living and better living conditions. The cities are more glamorous. They provide many sided entertainment through the clubs, cinema houses, television, hotels etc, where as villages lack all such facilities.

But on the other hand, due to overpopulation the cities become the centres of all the vices and crimes. In the big cities of USA many organized criminal gangs has come into existence. In

Scanned with CamScanner

certain big cities of Europe and US people don't come out in night due to the fear of these criminals. Thus big cities create many social and criminal problems.

In the big cities there is also the serious problem of housing. The authorities are always failing in their efforts to meet the housing demands of the people. The shortage of houses leads to overcrowding; insanitary conditions and it result in slums. The huge population of cities also leads to many transport problems like traffic jams, accidents, etc. The inhabitants of the cities also become very self-seeking and self-centered. They lack social feeling and sympathy for others.

Over population and overcrowding in cities always create so many problems for the Municipal authorities such as water shortage, electricity breakdowns etc. In certain big cities water is not available all the 24 hrs. Sometimes the water gets contaminated. It is also a problem to keep the streets, roads, etc properly cleaned. The high sky scrapers which are constructed in the big cities cause many problems. If by chance, a fire breaks out in these multi-story buildings, it is not easy to extinguish it.

It is also not easy to get anything pure in the big cities. Everything is either impure or adulterated because of larger demands and lesser supplies. One cannot get pure food, milk and even drinking water in the big cities. Everything available here is adulterated, which leads to many diseases among the urban people. Thus we see that the city people don't possess good health. Again the big cities are also very costly and the standard of living is very high there.

Instead of following the ideals of simple living and high thinking the people in big cities follow the ideal of high living and simple thinking. The urban people lead a very fast and busy life so as to maintain their high standard of living. They lead a very expensive and artificial life. On the other hand the people of the villages lead a natural life.

7. Conclusion

Of course, there are certain merits of city life also. The urban people do not believe in superstitions. They work hard to lead a higher standard of living. There is no doubt that most of the achievements of the modern world like the scientific and technological inventions and discoveries all have been made in the cities. There are many means of the entertainment in the cities. Even the best hospitals, schools, colleges and universities are located in the cities.

CHAPTER 20

VOCATIONAL TRAINING IN PAKISTAN

1. Introduction

The Government of Pakistan has higher priority on human resource development in general and through vocational training in particular for poverty alleviation and enhancement of job opportunity through skill. In order to coop the unemployment situation and to uplift the socio-economic condition, the importance of skilled manpower cannot be denied. Vocational training is an important instrument for transfer of knowhow and technologies to many sphere of life. Technical manpower is vital for enhancing productive capacity and ensure the sustainable economic of the country. The primary objectives of the vocational training are to train youth/ matric drop out from the high school in vocational skills to prepare them for the development of the economy of the country.

2. Importance of Vocational Training

In order to balance the demand and supply of trained manpower and to promote employment position, vocational training seeks to assist an individual in choosing a particular vocation and preparing himself for it. It provides an opportunity to the individual to develop his talent and skill and instil in him a sense of confidence, self-reliance and social usefulness. Vocational training in its totality refers to all formal and non-formal training activities taking place in all sector of economy.

Punjab Vocational Training Council (PVTC) is an autonomous corporate body established by the Punjab Government through the PVTC Act of 1998. Its mission is to alleviate poverty through Muslim charity (Zakat) and private sector participation by imparting demand driven skill training and enhancing employability for disadvantaged youth.

Establishment of PVTC came through the realization that the less privileged sections of the society eligible for Zakat should be so empowered economically that they are able to sustain themselves and their families and engage in dignified economic activity. One of the better ways to use Zakat was to provide technical and vocational skills to the youth including girls and boys with certain minimum academic qualifications. This idea of economic empowerment would generate a multiplier effect in terms of economic activity and provide dignified monthly income to them and their families so that they come out of the eligibility of Zakat bracket.

Imparting of skill training in market relevant trades would obviously bring much higher rate of return than general education. With the establishment of PVTC, training the young girls and boys into professionally equipped and trained craftsmen has brought quantifiable dividends in the lives of these people.

Scanned with CamScanner

3. DIL TRUST UK'S VOCATIONAL TRAINING PROGRAM INITIATIVE IN PAKISTAN

Since its inception in the 1997, DIL has successfully established over 250 girls' schools in some of the poorest, most remote areas in Pakistan's four provinces. Our main aim is to provide quality education, primarily free of cost, to girls living in rural areas and in communities where very little development has taken place. As of December 2018, 24,500 students were being educated in DIL schools in Pakistan. The education they receive is secular with a strong emphasis on the math, sciences and proficiency in English. DIL's aim is to equip students with the skills needed to compete in the job market.

DIL also runs teacher-training programmes, which are available to all DIL graduates and all its employees, through which DIL seeks to continually improve the quality of education offered in its schools. DIL is now developing vocational training courses (**VTC**) to provide further support to the communities in which DIL's schools are located. DIL's VTC programmes target young women, the families of DIL students, and the local communities where DIL schools are located. One of the first VTC's to be established by DIL will provide vocational training to the DIL school community in Orangi, which is located in Karachi and is one of the largest squatter settlements in the world.

4. TARGET GROUPS IN PAKISTAN

- **Primarily girl's** education in the rural and underdeveloped areas of Pakistan
- The **extended family of DIL Students** and the **local community** where DIL School are established in Pakistan, will be provided free Vocational Training courses.
- **All staff** as well as **former students** of the DIL School in Pakistan will be provided Teacher Training.

Long term initiative in Pakistan

- Extend the vocational training to other DIL school community in the four provinces of Pakistan.
- Provide **teacher training facility primarily to girls** (also extended to girls with UK passports living in various rural areas, which work in conjunction with the DIL Schools.
- **Adopting, purchasing and operating schools** presently closed down in the rural and underdeveloped areas of Pakistan; with the object to provide vocational training courses to that community.

DIL Trust UK is working on a number of noteworthy, **long-term development initiatives**, some of which have **ties to the United Kingdom**:

- Providing teacher training to staff and graduates from DIL schools as well as providing this facility to girls who have relocated to Pakistan from the UK following their marriage to a local individual (primarily in the Mirpur area)
- Long term goal- Work in conjunction with schools in England to have teachers go out to work and provide improvement to DIL's Teacher Training Institute.

- Long term goal- in conjunction with local and UK branches of financial institutions; establish a micro finance programme to help graduates and their families start up their own businesses.

5. THE ROLE OF TECHNICAL AND VOCATIONAL TRAINING IN ECONOMIC DEVELOPMENT

Technical and vocational education and training (TVET) lays emphasis on training for a specific career or trade. The training is mainly related to manual or practical professions and mostly does not involve theoretical and academic skills. The training is usually provided at high school level or at post-secondary trade schools to prepare the trainees for taking jobs that require skills and pay high salaries immediately after graduation, giving them an advantage over untrained job-seekers who learn about the required skills through formal training provided by the employers. In Pakistan, the TVET system is administered collectively by several agencies under the Ministries of Education, Labor and Manpower, Industries and Agriculture.

Earlier, vocational training was only used for specific occupations, mostly the activities of the lower social classes which mainly required manual skills and the use of machinery, however, since the end of the twentieth century, trades such as retail, management, information and technology, fashion and tourism have also witnessed a boom in TVET. It is because of the benefits it provides to the economy and the boost that it gives to development and poverty reduction that, technical education has been made one of the four top priority areas in the education programme launched by UNESCO.

Unemployment and under-employment are two of the most serious problems being faced by businesses in many countries, including Pakistan, and are becoming the obstacles in the path of economic development. One of the main causes of unemployment is the lack of skilled people or people with the required expertise. Perhaps the biggest advantage of TVET to the economy of a country is that it helps in fighting and alleviating unemployment. In fact, it has also been referred to as the solution to unemployment as it helps in developing the skills of the jobless people so that they can meet the requirements of employers during the recruitment process.

The key to economic growth and industrialization is a skilled and well-trained workforce, the provision of which is one of the main objectives of technical education. Improvement of youth employment has been defined as one of the most important objectives of the Millennium Development Goals. Vocational training of youth before they take on jobs will not only help in engaging them in productive activities but, it will also offer a guarantee for their better future. Gaining vocational skills will make the youth employable and counter social vices such as drug addiction, trafficking, activities of warlords and terrorist groups, migration and brain drain, gang involvement, theft etcetera which are consuming the youth because of their unemployment or under-employment. Therefore, increasing youth employment has great significance in terms of conflict prevention as well. Also, if an applicant has received vocational training before being hired, his employability will increase and moreover, he will not need to be trained by the employers which will save the time, money and in turn, the efficiency of the company.

Reducing unemployment can lead to the tackling of poverty which has been one of the main hindrances in the development of the poor underdeveloped or developing nations, commonly referred to as third world countries. Pakistan has been facing the same problem since

Scanned with CamScanner

its creation in 1947 and poverty, unemployment and illiteracy are the main drawbacks to developmental plans even today. Technical and vocational education in Pakistan is currently being affected by a set of factors.

The huge number of poorly educated, unskilled and unemployed youth in Pakistan is acting as a hindrance in promotion of technical education. Youth, that is people between ages 15 to 24, make up a major part of Pakistan's working age population, a composition which poses both potential risks and threats. However, the youth is faced by many challenges in the labor market which are mainly a lack of education, experience and skill. Over 52 percent of the youngsters are not included in the labor market and over 22 percent of those constituting the workforce find problems in finding jobs. This unemployment rate is much greater than the adult unemployment rate in Pakistan. Furthermore, the enrolment and completion rates in various TVET courses offered in Pakistan are generally low which is resulting in the under utilization of the existing facilities.

For many years, technical and vocational education in Pakistan has been considered as a career path for the less academically endowed. This perception has been fuelled by the low academic requirements for admission into TVET programmes and the limited prospects for further education and professional development. All these factors lead to low social recognition and awareness regarding vocational training in Pakistani people.

The training quality is generally low and emphasis is greatly laid upon theory and certification rather than on skills acquisition and proficiency testing. Inadequate instructor training, obsolete training equipment, and lack of instructional materials are some of the factors that combine to reduce the effectiveness of training in meeting the required knowledge and skills objectives. To provide efficient training and skills, qualified instructors, appropriate workshop equipment, adequate supply of training materials, and practice by learners are required which are lacking in the TVET system of Pakistan. The course material is outdated and usually interaction between industry and the world of work is lacking. Moreover, the relationship between the curriculum development, occupational skills development and accreditation is missing. Consequently the quality of output is not very high.

Large numbers of graduates coming out of the formal school system are unemployed, although opportunities for skilled workers do exist in the economy. This situation has brought into sharp focus the mismatch between training and labour market skill demands. Critics argue that the lack of inputs from prospective employers into curriculum design and training delivery in universities and colleges is partly responsible for the mismatch. Another reason that is often cited for the incidence of high unemployment among graduates is the absence of entrepreneurial training in the school curriculum.

Technical education is linked to general education, however, practically, vocational education has been and considered as a separate stream in the education system of Pakistan. Mostly it has received less attention and input as it can be seen by the bar graph (above) showing the comparisons between the allocation of budget in the general education sector and the sector for technical and vocational education and training in Pakistan.

The promotion of technical and vocational education and training for industrialization, economic development, wealth creation and poverty eradication demands policies and strategies that address the cross-cutting issues of quality and relevance of training, employability, collaboration between training institutions and employers, accreditation of training providers (in

the formal, non-formal and informal sectors), assessment, certification, internal and external quality assurance of training programmes, funding, and instructor training. This calls for a TVET system that is competency-based and employment led, with proficiency testing of learners and trainees as proof of competence. TVET should also be seen and acknowledged by all stakeholders as a valid passport to a well-paid job or self-employment or higher education and not as an alternative educational opportunity fit only for early school leavers, the less academically endowed or the poor.

Finally, the point has to be made that technical and vocational education and training alone by itself does not lead to rapid industrialization, or provision of jobs or eradication of poverty. Good government policies do all three. National governments therefore, need to create an economic environment that promotes the growth of enterprises and generally stimulates the economy. When businesses develop and expand, additional labor-market demands for technical and vocational training emerge, and new job and further training opportunities are created to trace and light the path of industrialization. For this to happen on a sustainable basis, however, the TVET system must be labor-market relevant, equitable, efficient, and of high quality. This is the challenge that Pakistan's government and training institutions must rise up to in order to lead Pakistan towards economic prosperity.

6. TEVTA

TEVTA was formed through an Ordinance (No XXIV of 1999) promulgated by Governor of the Punjab which has now been replaced by TEVTA ACT (ACT X of 2010) Punjab.

Mission statement

To enhance global competitiveness in Punjab, through a quality and productive workforce by developing demand driven, standardized, dynamic and integrated technical education and vocational training service.

Objectives

- Promote and provide demand driven technical education & vocational training.
- Re-engineer and consolidate the existing technical education and vocational training system under one management structure.
- Develop a dynamic technical and vocational training system to ensure horizontal and vertical mobility.
- Regulate and develop standards of technical education and vocational training including internationally recognized curriculum, examination and certification system.
- Upgrade teaching abilities, skills and knowledge of teaching staff.
- Upgrade teaching equipment to the required standards.
- Establish close relationship with various sectors of economy namely Agriculture, industry, Services and Commerce.
- Assess the manpower training needs in the context of domestic and global markets.
- Enhance the participation of Private Sector in training activities at Management level.
- Establish a system of public coordination through Boards of Management at District level, coordinating all institutions in the District and their administration.

Scanned with CamScanner

- Motivate the local entrepreneurs to patronize the training programs of TEVTA institutions, provide on-the-job training facilities and employment to the graduates.
- Set up regular Monitoring/Evaluation & Feedback system for the vocational training and teaching education to respond efficiency to the existing and changing demand of the economy.
- Develop & regulate examination, Trade Testing & Certification System to ensure uniformity of Education & Training Standards.
- Prepare training plans, programs and projects keeping in view the local as well as foreign manpower training requirements.
- Study and propose changes in the existing training legislations.
- Develop and offer need-based short courses in the sector of new technologies to the Industry and also to offer services for solutions regarding associated production problems.
- Establish a staff development system to offer demand oriented teacher & instructor training and upgrading performance.
- Organize and conduct seminars & workshops for various types of personnel associated with vocational training and technical education.
- Establish Data Banks for skilled workers and technicians.

CHAPTER 21

SOCIAL NORMS

INTRODUCTION

Social Norms are unwritten rules about how to behave. They provide us with an expected idea of how to behave in a particular social group or culture. For example we expect students to arrive to lesson on time and complete their work.

The idea of norms provides a key to understanding social influence in general and conformity in particular. Social norms are the accepted standards of behaviour of social groups.

These groups range from friendship and work groups to nation states. Behaviour which fulfils these norms is called conformity, and most of the time roles and norms are powerful ways of understanding and predicting what people will do.

MEANING

Pattern of behaviour in a particular group, community, or culture, accepted as normal and to which an individual is accepted to conform.

DEFINITION

A social norm is the accepted behaviour that an individual is expected to conform to in a particular group, community, or culture. These norms often serve a useful purpose and create the foundation of correct behaviours. In other words, social norms allow you to expect the events that will occur in a particular setting. This allows you to prepare yourself for a situation and reduces the amount of stress that you would feel leading up to a situation that you felt uncertain of what was expected.

Social norms are most noticeable when they are not followed. They remain stable because most people are taught to follow them and agree to do so willingly. Even if a person doesn't feel like following a social norm, he or she may do it because of the social pressure that's placed on him or her to conform.

EXAMPLES

There are norms defining appropriate behaviour for every social group. For example, students, neighbours and patients in a hospital are all aware of the norms governing behaviour. And as the individual moves from one group to another, their behaviour changes accordingly.

Scanned with CamScanner

Norms provide order in society. It is difficult to see how human society could operate without social norms. Human beings need norms to guide and direct their behaviour, to provide order and predictability in social relationships and to make sense of and understanding of each other's actions. These are some of the reasons why most people, most of the time, conform to social norms.

Function of a Social Norm

The function of a social norm is to coordinate people's expectations in interactions that possess multiple equilibrium. Norms govern a wide range of phenomena, including property rights, contracts, bargains, forms of communication, and concepts of justice. Norms impose uniformity of behaviour within a given social group, but often vary substantially among groups. Over time norm shifts may occur, prompted either by changes in objective circumstances or by subjective changes in perceptions and expectations. The dynamics of this process can be modelled using evolutionary game theory, which predicts that some norms are more stable than others in the long run.

Emergence and Transmission

Every day there are new rules put into place, as well as old rules that are more structured whether it be for a group or an individual. Yet, not only do humans make rules, they strive on finding the rules that come eye to eye about how the world works. These rules, once accepted by an individual or a group after trial and error, then become a norm.

Groups may adopt norms through a variety of ways. Norms can arise formally, where groups explicitly outline and implement behavioural expectations. Laws or club rules serve as an example of this. A large number of these norms we follow 'naturally' such as driving on the right side of the road in the US and on the left side in the UK, or not speeding in order to avoid a ticket. Many formal norms serve to provide safety to the general public.

However, social norms are much more likely to develop informally, emerging gradually as a result of repeated use of discretionary stimuli to control behaviour. Not necessarily laws set in writing, informal norms represent generally accepted and widely sanctioned routines that people follow in everyday life. These informal norms, if broken, may not invite formal legal punishments or sanctions, but instead encourage reprimands, warnings, or bothering; incest, for example, is generally thought of as wrong in society, but many jurisdictions do not legally prohibit it.

Transfer of Norms Between Groups

Individuals

Individuals may also import norms from a previous organization to their new group, which can get adopted over time. Without a clear indication of how to act, people typically rely on their past history to determine the best course forward; what was successful before may serve them well again. In a group, individuals may all import different histories or scripts about appropriate behaviours; common experience over time will lead the group to define as a whole its take on the right action, usually with the integration of several members' schemas. Under the importation paradigm, norm formation occurs subtly and swiftly whereas with formal or informal development of norms may take longer.

Groups

Groups internalize norms by accepting them as reasonable and proper standards for behaviour within the group. Once firmly established, a norm becomes a part of the group's operational structure and hence more difficult to change. While possible for newcomers to a group to change its norms, it is much more likely that the new individual will adopt the group's norms, values, and perspectives, rather than the other way around.

Deviance from Social Norms

Deviance is defined as "nonconformity to a set of norms that are accepted by a significant number of people in a community or society." More simply put, if group members do not follow a norm, they become labelled as a deviant. In the sociological literature, this can often lead to them being considered outcasts of society. Yet, deviant behaviour amongst children is somewhat expected. Except the idea of this deviance manifesting as a criminal action, the social tolerance given in the example of the child is quickly withdrawn against the criminal. Crime is considered one of the most extreme forms of deviancy according to scholar Clifford R. Shaw.

What is considered "normal" is relative to the location of the culture in which the social interaction is taking place. In psychology, an individual who routinely disobeys group norms runs the risk of turning into the "institutionalized deviant." Similar to the sociological definition, institutionalized deviants may be judged by other group members for their failure to adhere to norms. At first, group members may increase pressure on a non-conformist, attempting to engage the individual in conversation or explicate why he or she should follow their behavioural expectations. The role in which one decides on whether or not to behave is largely determined on how their actions will affect others. Especially with new members who perhaps do not know any better, groups may use discretionary stimuli to bring an individual's behaviour back into line. Over time, however, if a member continues to disobey, the group will give up on him as a lost cause; while the group may not necessarily revoke his membership, they may give him only superficial consideration. If a worker is late to a meeting, for example, violating the office norm of punctuality, a boss or other co-worker may wait for the individual to arrive and pull him aside later to ask what happened. If the behaviour continues, eventually the group may begin meetings without him since the individual "is always late." The group generalizes the individual's disobedience and promptly dismisses it, thereby reducing the member's influence and footing in future group disagreements.

Group Tolerance

Group tolerance for deviation varies across membership; not all group members receive the same treatment for norm violations. Individuals may build up a "reserve" of good behaviour through conformity, which they can borrow against later. These idiosyncrasy credits provide a theoretical currency for understanding variations in group behavioural expectations. A teacher, for example, may more easily forgive a straight-A student for misbehaving—who has past "good credit" saved up—than a repeatedly disruptive student. While past performance can help build idiosyncrasy credits, some group members have a higher balance to start with. Individuals can import idiosyncrasy credits from another group; childhood movie stars, for example, who enrol in college, may experience more leeway in adopting school norms than other incoming freshmen. Finally, leaders or individuals in other high-status positions may begin with more credits and be appear to be "above the rules" at times. Even their idiosyncrasy credits are not bottomless,

Scanned with CamScanner

however; while held to a more lenient standard than the average member, leaders may still face group rejection if their disobedience becomes too extreme.

Deviance

Deviance also causes multiple emotions one experiences when going against a norm. One of those emotions can be widely attributed to guilt. This emotion is connected to the ethics of duty which in turn becomes a primary object of moral obligation. Guilt is followed by an action that is questioned after its doing. It can be described as something negative to the self as well as a negative state of feeling. Used in both instances, it is both an unpleasant feeling as well as a form of self-punishment. Using the metaphor of "dirty hands", it is the staining or tainting of oneself and therefore having to self-cleanse away the filth. It is a form of reparation that confronts oneself as well as submitting to the possibility of anger and punishment from others. Guilt is a point in both action and feeling that acts as a stimulus for further "honourable" actions.

Some research indicates that changes in the weather can increase the likelihood of children exhibiting deviant behaviour.

Behaviour

Norms running counter to the behaviours of the overarching society or culture may be transmitted and maintained within small subgroups of society. For example, Crandall (1988) noted that certain groups (e.g., cheerleading squads, dance troupes, sports teams, and sororities) have a rate of bulimia, a publicly recognized life-threatening disease that is much higher than society as a whole. Social norms have a way of maintaining order and organizing groups.

TYPES

Descriptive Versus Injunctive

Descriptive norms depict what happens, while injunctive norms describe what should happen. Cialdini, Reno, and Kallgren (1990) define a descriptive norm as people's perceptions of what is commonly done in specific situations; it signifies what most people do, without assigning judgment. The absence of trash on the ground in a parking lot, for example, transmits the descriptive norm that most people there do not litter. An Injunctive norm, on the other hand, transmits group approval about a particular behaviour; it dictates how an individual should behave. Watching another person pick up trash off the ground and throw it out, a group member may pick up on the injunctive norm that he ought to not litter.

Prescriptive and Proscriptive

Prescriptive norms are unwritten rules that are understood and followed by society and indicate what we should do. Expressing gratitude or writing a Thank You card when someone gives you a gift represents a prescriptive norm in American culture. Proscriptive norms, in contrast, comprise the other end of the same spectrum; they are similarly society's unwritten rules about what one should not do. These norms can vary between cultures; while an acceptable greeting in some European countries, kissing a stranger on the cheek constitutes a proscriptive norm in the United States.

Subjective

Subjective norm is determined by beliefs about the extent to which important others want them to perform behaviour. Social influences are conceptualized in terms of the pressure that people perceive from important others to perform, or not to perform, behaviour.

SOCIAL NORMS THEORY

The Social Norms Theory was first used by Perkins and Berkowitz in 1986 to address student alcohol use patterns. As a result, the theory, and subsequently the social norms approach, is best known for its effectiveness in reducing alcohol consumption and alcohol-related injury in college students. The approach has also been used to address a wide range of public health topics including tobacco use, driving under the influence prevention, seat belt use, and more recently sexual assault prevention. The target population for social norms approaches tends to be college students, but has recently been used with younger student populations (i.e., high school).

This theory aims to understand the environment and interpersonal influences (such as peers) in order to change behavior, which can be more effective than a focus on the individual to change behavior. Peer influence, and the role it plays in individual decision-making around behaviors, is the primary focus of Social Norms Theory. Peer influences and normative beliefs are especially important when addressing behaviors in youth. Peer influences are affected more by perceived norms (what we view as typical or standard in a group) rather than on the actual norm (the real beliefs and actions of the group). The gap between perceived and actual is a misperception, and this forms the foundation for the social norms approach.

The Social Norms Theory posits that our behavior is influenced by misperceptions of how our peers think and act. Overestimations of problem behavior in our peers will cause us to increase our own problem behaviors; underestimations of problem behavior in our peers will discourage us from engaging in the problematic behavior. Accordingly, the theory states that correcting misperceptions of perceived normswill most likely result in a decrease in the problem behavior or an increase in the desired behavior.

Social norms interventions aim to present correct information about peer group norms in an effort to correct misperceptions of norms. In particular, many social norms interventions are social norms media campaigns where misperceptions are addressed through community-wide electronic and print media that promote accurate and healthy norms about the health behavior. The phases of a social norms media campaign include:

- Assessment or collection of data to inform the message
- Selection of the normative message that will be distributed
- Testing the message with the target group to ensure it is well-received
- Selection of the mode in which the message will be delivered
- Amount, or dosage, of the message that will be delivered
- Evaluation of the effectiveness of the message

Social norms media campaigns are currently being funded by many federal agencies, state agencies, foundation grants, and non-profit organizations. Sometimes social norms media campaigns are funded by industry. There has been a good deal of evaluations conducted on social norms campaigns. Case studies of effective social norms campaigns can be found here:

Scanned with CamScanner

There are several limitations of Social Norms Theory that need to be considered prior to using the theory. Limitations of the theory include the following:

- Participants of an intervention focused on social norms are likely to question the initial message being presented to them due to misperceptions they hold. Information must be presented in a reliable way to correct those misperceptions.
- Poor data collection in the initial stages can lead to unreliable data and poor choice of normative message. This can undermine the campaign and reinforce misperceptions.
- Unreliable sources, or sources that are not credible to the target population, can result in an unappealing message that undermines the campaign, even if the message is correctly chosen.
- The dose, or amount, of the message received by the target population must be enough to make an impact, but not too much that it becomes commonplace.

Although these limitations exist, when used correctly Social Norms Theory can be very effective in changing individual behavior by focusing on changing misperceptions at the group level. Social norms interventions can be used alone or in conjunction with other types of intervention strategies. The most effective social norms interventions are those that have messages targeted to the at-risk population that are correct and influential. To target messages, a substantial amount of research and data collection has to be invested to understand the norms that exist in the group of interest. Social norms interventions are also most effective when presented in interactive formats that actively engage the target audience.

CONCLUSION

Social norms operate to build society, maintain society, and challenge society. Whether or not we adhere or follow the norms of our society, we are participating in society, to either maintain it or challenge it.

PAPER II
