1 DECIDE: A framework to guide evaluation 5m

Well-planned evaluations are driven by clear goals and appropriate questions (Basili et al., 1994). To guide our evaluations we use the DECIDE framework, which provides the following checklist to help novice evaluators:

1. Determine the overall *goals* that the evaluation addresses.
2. Explore the specific *questions* to be answered.
3. Choose the *evaluation paradigm* and *techniques* to answer the questions.
4. Identify the *practical issues* that must be addressed, such as selecting participants.
5. Decide how to deal with the *ethical issues.*

6. Evaluate, interpret, and present the *data*

2 Applying ethnography in design 5m

Ethnography is a method that comes originally from anthropology and literally means "writing the culture". It has been used in the social sciences to display the social organization of activities, and hence to understand work. It aims to find the order within an activity rather than impose any framework of interpretation on it. It is a broad-based approach in which users are observed as they go about their normal activities.

3 Alerts and Confirmations 5m

Like error dialogs, alerts and confirmations stop the proceedings with idiocy, but they do not report malfunctions. An alert notifies the user of the program's action, whereas a confirmation also gives the user the authority to override that action. These dialogs pop up like weeds in most programs and should, much like error dialogs, be eliminated in favor of more useful idioms.

4 Qualities of Qualitative research 5m

Providing credibility and authority to the design team, because design decisions can be traced to research results

• Uniting the team with a common understanding of domain issues and user Concerns.

Existing products and how they are used.

• Potential users of new or existing products, and how they currently approach activities and problems the new product design hopes to address

• Technical, business, and environmental contexts—the domain—of the product to be designed

• Vocabulary and other social aspects of the domain in question

5 Improving Navigation 5

There are many ways to begin improving (eliminating, reducing, or speeding) navigation

in your applications, Web sites, and devices. Here are the most effective:
• Reduce the number of places to go
• Provide signposts
• Provide overviews
• Provide appropriate mapping of controls to functions
• Inflect your interface to match user needs
• Avoid hierarchies

6 Blind and explanatory undo 3m

Normally, undo is invoked by a menu item or toolbar control with an unchanging label or icon. The user knows that triggering the idiom undoes the last operation, but there is no indication of what that operation is. This is called a blind undo. On the other hand, if the idiom includes a textual or visual description of the particular operation that will be

undone it is an explanatory undo.

Explanatory
undo is, generally, a much more pleasant feature than
blind undo. It is fairly easy to put on a menu item, but more difficult to put on a toolbar control, although putting the explanation in a ToolTip is a good compromise.

7 Stanford sociologists 3m

In The Media Equation (Cambridge University Press, 1996), Stanford sociologists Clifford Nass and Byron Reeves make a compelling case that humans treat and respond to computers and other interactive products as if they were people. We should thus pay real attention to the "personality" projected by our software.

8 components_ to achieve web 3m

There are two key components to any effort to achieve web accessibility:
• Commitment and accountability
• Training and technical support

9 Focus group 3m

• Used by marketing organizations
• Used in traditional product marketing
• Representative users gathered in room
• Shown a product and reactions gauged
• Reactions recorded by audio/video

10 constructing context scenarios 5m

Scenarios are stories about people and their activities. Context scenarios are, in fact, the most story-like of the three types of scenario we employ in that the focus is very much on the persona, her mental models, goals, and activities. Context scenarios describe the broad context in which usage patterns are exhibited and include environmental and organizational considerations. Context scenarios establish the primary touch-points that

each primary and secondary persona has with the system over the course of a day, o some other meaningful length of time that illuminates modes of frequent and regular use. Context scenarios are sometimes, for this reason, called day-in-the-life scenarios. Context scenarios address questions such as the following

- What is the setting in which the product will be used?
- Will it be used for extended amounts or time?
- Is the persona frequently interrupted?
- Are there multiple users on a single workstation/device?
- What other products is it used with?
- How much complexity is permissible, based on persona skill and frequency of use?
- What primary activities does the persona need to accomplish to meet her goals?

- What is the expected end result of using the product?

11 Transient elements 3 m

In addition to auxiliary elements, an environmental portal often provides transient portal services as well. Their complexity is minimal; they are rich in explanatory elements, and they are used for short periods on demand. Designers should give a transient posture to any embedded portal service that is briefly and temporarily accessed (such as a to-do list or package-tracking status display) so that it does not compete with the sovereign/auxiliary posture of the portal itself. Rather it becomes a natural, temporary extension of it.

12 Low fidelity 5m
prototyping techniques drawbacks

As we said in earlier lecture, sketches, screen mockups, and other lowfidelity prototyping techniques are used to represent design ideas. Many of these same techniques are used to elicit users" opinions in evaluation (e.g., questionnaires and interviews), but the purpose and focus of evaluation are different. The goal of evaluation is to assess how well a design fulfills users' needs and whether users like it.

13 Difference Semi-structured interviews Group interviews 5m

Semi-structured interviews

Semi-structured interviews combine features of structured and unstructured inter views and use both closed and open questions. For consistency the interviewer has a basic script for guidance, so that the same topics arc covered with each interviewee.

Group interviews

One form of group interview is the focus group that is frequently used in marketing, political campaigning, and social sciences research. Normally three to 10 people are involved. Participants are selected to provide a representative sample of typical users;

they normally share certain characteristics. For example, in an evaluation of a university website, a group of administrators, faculty, and students may be called to form three separate focus groups because they use the web for different purposes.

14 Difference between Semi-structure interview and focus group interview (Page#373)

Focus Group Interview

One form of group interview is the focus group that is frequently used in marketing, political campaigning, and social sciences research.

Normally three to 10 people are involved.

Focus groups are also attractive because they are low-cost, provide quick results, and can easily be scaled to gather more data

A preset agenda is developed to guide the discussion

Answer:- Semi-Structure Interview

Semi-structured, interviews combine features of structured and unstructured inter views and use both closed and open questions.

Use of pre-determined questions provides uniformity

Requires some level of training or practice in order to prevent interviewer suggesting answers

It also allows respondents to discuss and raise issues that you may not have considered

15 The Skeleton Plane 3m

Beneath that surface is the skeleton of the site: the placement of buttons, tabs, photos, and blocks of text. The skeleton is designed to optimize the arrangement of these elements for maximum effect and efficiency-so that you remember the logo and can find that shopping cart button when you need it.

16 Active Intervention 3m

Active intervention is a technique in which a member of the test team sits in the room with the participant and actively probes the participant's understanding of whatever is being tested. For example, you might ask participants to explain what they would do next and why as they work through a task.

17 Differentiate between Visual Art and Visual Design?

Visual Design

- Visual design is the way a piece of artwork, a room, yard, video game, photo or other artistic subject is composed and appeals to the human eye.
- Photoshop designs for each page, page type, module within an app/site/software.
- Creates or contributes to style guides detailing how everything looks and how it fits into the larger strategy.

Answer:- Visual Art

- Visual art is art such as paintings, photographs, sculptures.
- The term visual art separates those kinds of art from music, dance, and drama.
- It is two-dimensional. Visual arts are things like paintings, drawings, visual designs, photography, and computer art.
- There is no "designing" for a purpose; it's just creating something visually appealing.

18 Usability tests? (Page#275)

Answer:-

In most usability tests, you have one participant at a time working with the product. You usually leave that person alone and observe from a corner of the room or from behind a one-way mirror.

B	**Match the following regarding Goal-Directed Design** A
Users and use Context	Research
Definition of user, business& technical needs	Modeling
Definition of design structure & flow	Requirements
Of behavior, form & content	Framework
User and the Domain	Refinement

20 Explain any four disadvantages of Low-fidelity prototyping. 3m

Answer:-

1. Limited error checking.

2. Poor detailed specification to code to.

3. Facilitator-driven.

4. Limited utility after requirements established.

21 What is meant by term "Color shows relationships" with respect to misuse of colors in visual Interface? (Page#358)

Answer:-

Color shows relationships. Color can provide a means of grouping or relating objects together.

24 **Name types of navigation**.

Navigation between multiple windows or screens

Navigation between panes within a window (or frames in a page)

Navigation between tools or menus in a pane

Navigation within information displayed in a pane or frame (for example: scrolling, panning, zooming, following links

25 Explain any four disadvantages of Low-fidelity prototyping.

Answer:-

1. Limited error checking.

2. Poor detailed specification to code to.

3. Facilitator-driven.

4. Limited utility after requirements established

26 What is meant by term "Color shows relationships" with respect to misuse of colors in visual Interface? (Page#358)

Answer:-

Color shows relationships. Color can provide a means of grouping or relating objects together.

27 Suppose you are an HCI specialist and have to perform the usability testing for those products that do not even have to involve any hardware or software. Which usability testing techniques you will use in this case. (Page#259)

Answer:-

Usability testing was the dominant approach in the 1980s (Whiteside et al., 1998), and remains important, although, as you will see, field studies and heuristic evaluations have grown in prominence.

28 You are a software engineer and design different applications that are usable for users without modifications. How do you define accessibility with respect to emerging paradigm? (Page#408)

Answer:-

Accessibility is a general term used to describe the degree to which a system is usable by as many people as possible without modification. It is not to be confused with usability which is used to describe how easily a thing can be used by any type of user. One meaning of accessibility specifically focuses on people with disabilities and their use of assistive devices such as screen-reading web browsers or wheelchairs.

29 Suppose you are a system analyst, with your work experience, briefly describe when it is useful to observe in contrast to observation process? (Page#361)

Answer:-

Being a system analyst, Early in design, observation helps designers understand users' needs. Other types of observation are done later to examine whether the developing prototype meets users' needs.

Negative Audible Feedback:

- **Error Beep**: A short, sharp beep indicating an incorrect action or an error, like pressing the wrong button on a keypad.

Positive Audible Feedback:

- **Chime Sound**: A pleasant and melodic sound often used to indicate successful completion of a task, like when a microwave finishes heating food.

T

Six Input events of peripheral devices name only

Sure, here are six input events from peripheral devices:

1. Keyboard key press
2. Mouse click
3. Touchscreen tap
4. Joystick movement
5. Gamepad button press
6. Stylus pressure detection

T

Planes of conceptual frame work

Certainly, here's a concise explanation of the three planes of a conceptual framework:

1. **Epistemological Plane**: Focuses on how knowledge is gained.
2. **Ontological Plane**: Explores the nature of reality and existence.
3. **Methodological Plane**: Deals with data collection and analysis methods.

T

How to avoid error messages. In short form

To avoid error messages:

- **Clear Instructions**: Provide straightforward guidance.
- **User Validation**: Check input for correctness.
- **Help Resources**: Offer tooltips or guides.
- **Defaults**: Use sensible defaults when possible.
- **User Testing**: Test with diverse users for feedback.

T

How the quantitative data be expressed in short form

Quantitative data can be expressed using numbers, measurements, or counts to quantify a particular aspect of a phenomenon.

T

Six Input events of peripheral devices name only

Sure, here are six input events from peripheral devices:

1. Keyboard key press
2. Mouse click
3. Touchscreen tap
4. Joystick movement
5. Gamepad button press
6. Stylus pressure detection
