CHAPTER 1

1. Difference between semantic and pragmatics?

ANS:

Semantic	Pragmatics
Semantics is the part of linguistics that is concerned with the study of literal, DE-contextualized and grammatical meaning.	Pragmatics is the study of meaning as communicated by the speaker and interpreted by the listener.
it is the study of the relationships between signs and symbols and what they represent.	This includes background knowledge context i.e. people know about each other and the world.

2. Difference between sentence and utterances?

Ans:

Sentence	Utterances
Sentences are linguistic entities and there are semantic facts about any language concerning the meanings of its words and the ways in which they can combine together to give meaning.	an utterance is an instance of the production of a sentence or a fragment of a sentence.
the sentence does not. Sentences are abstract linguistic structures; they do not have contexts and they are not produced by speakers or received by hearers.	utterance will have spatio-temporal and physical properties

3. Explain implicit and explicit meaning?

Ans: explicit: The explicit meaning of a word, phrase, or statement is the straightforward and clear interpretation that can be easily understood without additional context or interpretation. It is the surface-level meaning that is directly conveyed by the words used.

Example:

Sentence: "The cat is on the mat."

In this sentence, the explicit meaning is straightforward and clear. It indicates that a cat is located on a mat. There is no hidden or implied message, and the words directly convey the information without the need for interpretation.

Implicit:

Implicit meaning refers to the underlying or implied significance of a word, phrase, or expression that may not be explicitly stated. It involves the unspoken connotations, suggestions, or interpretations that are conveyed indirectly and are often dependent on context, cultural understanding, or shared knowledge.

For example, the tone of voice, body language, or cultural references in a conversation can convey implicit meanings that add depth and layers of interpretation beyond the explicit words spoken.

4. What is meant by the term “logic” in language?

Ans: Logic is concerned with ways in which ideas relate to each other, can be combined together and can be used to derive other ideas with confidence. Logicians tend not to talk about ‘ideas’ though; the basic unit of traditional logic is the ‘proposition’; a significant term in the discussions of meanings in linguistics.

CHAPTER 2**1. Describe semantics according to Palmer and saeed?**

Ans: Semantics is a technical term used to refer to the study of meanings. The meaning covers a variety of aspects of the language but unfortunately, there is no general consideration to describe it (Palmer, 1997).

Modern linguistics includes various meditations regarding the knowledge of linguistics, i.e. how to pronounce the words, construct sentences and meanings (Saeed, 2004)

2. How Chomsky define semantic ?

Ans: Chomsky, in particular, has commented on the creativity of the sentence formation. It is one of the generative grammar’s most important insights that relatively a small number of combination rules allow the speakers to use a finite set of words to create a very large and infinite number of sentences.

3. Define semiotic ?

Ans: Semiotics is the study of signs and symbols and their interpretation, particularly how meaning is conveyed through various elements such as language, images, sounds, and gestures. It is a field that examines the processes of signification and communication in different forms, exploring how signs and symbols function in conveying meaning within a specific cultural or social context.

In semiotics, a "sign" is a basic unit of meaning, and it can take various forms. There are typically three components to a sign:

1. Signifier: This is the physical form of the sign, such as a word, image, sound, or gesture.

2. Signified: This is the concept or idea represented by the signifier. It is the meaning associated with the sign.

3. Referent: In some cases, there might be a real-world object or phenomenon to which the sign refers. This is known as the referent.

Semiotics encompasses both verbal and non-verbal communication, and it is used to analyze how signs and symbols operate in different cultural, social, and linguistic contexts.

4. Write down the types of sign?

Ans: Distinction, highlighted by C. S. Peirce, between Icon, Index and Symbol.

- Iconic signs: Signs where the signifier resembles the signified.
- Similarity between a sign and what it represents. e.g., between a picture and its real-life subject.
- Indexical Signs: Signs where the signifier is caused by the signified.

Chapter 3**1. What is the difference b/w “reference” and “sense” ?**

Ans:

Reference	Sense
Reference has to do with the relationship which holds between an expression and what that expression stands for on particular occasions of its utterance	Sense is a decontextualized meaning, abstracted from innumerable occurrences in texts
reference can be concluded as the meanings of a word in any language which exist in the real world.	Sense relates to the complex system of relationships between the linguistic elements themselves.

2. Define proposition?

Ans: According to Haug (2014), proposition is a declarative sentence, when uttered to make a statement, that is, to say something true or false, about some state of affairs in the external world. The word proposition has come from philosophy and is the lowest level of language. Propositions are words that exist in the lexicon and have a meaning.

3. Describe the literal and non-literal meaning?

Ans: Literal meaning:

According to Saeed (2003), Literal Meanings - told by a dictionary of that language are called conventional meanings. These meanings are a description of the word to which it refers to in the real world. These are Instances where the speaker speaks in a neutral, factually accurate way. E.g. —I am hungry or I am starving. The source of these meanings is a society which gives meaning to the words. These meanings are also called conceptual meaning.

Non-literal meaning:

Non-Literal Meanings are Instances where the speaker deliberately describes something in untrue or impossible terms in order to achieve special effects. For instance, —I could eat a horse or —my stomach is screaming for food. Non-Literal Meanings are also traditionally called figurative and are described by a host of rhetorical terms including metaphor, irony, metonymy, etc. (Saeed, 2003, p.17). These are associated meaning of the words - symbolic meaning.

Chapter 4**1. Write a brief note on meaning? Also point out its types?**

Ans: Semantics deals with the study of meaning. The verb ‘mean’ has multiple meanings/ senses in dictionary.

There are several types of meaning, and they can be categorized in various ways based on linguistic, philosophical, or communicative perspectives. Here are some common types of meaning:

- 1. Denotative Meaning:** This is the literal, dictionary definition of a word. It refers to the specific, explicit meaning that can be found in a dictionary.
- 2. Connotative Meaning:** Connotative meaning involves the emotional or cultural associations that a word carries beyond its literal definition. These associations can be positive, negative, or neutral and may vary among different individuals or communities.
- 3. Conceptual Meaning:** This type of meaning refers to the abstract or general idea represented by a word. It is related to the underlying concept or category that a word signifies.
- 4. Associative Meaning:** This pertains to the connections or mental links between words and the ideas, emotions, or memories they evoke. These associations can be personal or culturally shared.
- 5. Referential Meaning:** Refers to the relationship between a linguistic expression and the external world. It involves what a word or phrase points to in reality.
- 6. Social Meaning:** Language is inherently social, and certain words or expressions can carry social significance or convey information about social relationships, status, or identity.
- 7. Pragmatic Meaning:** This type of meaning is context-dependent and is influenced by the communicative context, speaker's intentions, and the relationship between the interlocutors.
- 8. Symbolic Meaning:** Involves the use of symbols to represent ideas, concepts, or objects. Symbols often have cultural or societal significance and can convey complex meanings.
- 9. Operational Meaning:** Refers to the practical or functional meaning of a term in a specific context, especially in technical or specialized fields.
- 10. Aesthetic Meaning:** Relates to the artistic or aesthetic qualities of language, including the emotional impact of words, stylistic choices, and creative expression.

2. Explain the principle of compositionality?

Ans: This theory says that the meaning of a piece of language is based solely on the meaning of its parts, and the way they are put together. With this theory we come to know that semantics has a very strong relation with syntax. To understand the structure of a sentence we need to have enough knowledge about its components such as noun, verb, adjective etc.

3. Explain the phrase “meanings are out in the world”?

Ans: There are certain philosophical views/theories which lead us to think that ‘meanings are out in the world’. Some theorists believe that meanings are social practices. When somebody says something, it should be thought as a kind of move in a giant language game we play. This game has rules which imply that if somebody asks: ‘What time is it?’ The reasonable move for you is to say ‘It is X o’clock’. This theory failed to influence semanticists. In conflict with one of the basic ideas of

modern linguistics - our languages are not arbitrary social conventions rather reveal deeper universal patterns which spring from the way our minds are built. It also ignores the key role of intuition in meaning making. Secondly, reference as a theory of meaning, the simplest theory of meaning is to claim that semantics is a reference (Saeed, 2004). To give the meaning of a word one shows what it denotes. Proper names denote individuals, whereas, common nouns denote sets of individuals.

‘Reference’ picks out elements in the real world.

Chapter 5

1. Difference between linguistic and connotative meaning?

Ans: Linguistic meaning is called ‘denotative’, ‘logical’ or ‘cognitive’ meaning. This refers to the definition given in the dictionary. Any piece of language is structured simultaneously on more than one level – at least three levels are necessary for linguistic competence. These levels are necessary to generate or understand linguistic utterances.

Connotative meaning:

This is the communicative value attributed to an expression, by virtue of what it refers to, over and above its purely conceptual meaning. Connotative meanings include not only physical characteristics but also psychological and social properties. Connotative meanings are concerned with the real-world experiences, one associate with the expressions one uses or hears.

2. Difference between social and affective meaning?

Ans: Social meanings are those which a piece of language conveys about the social circumstances of its use. We decode the social meaning of a text through our recognition of various dimensions and levels of style within the same language. We recognize some words or pronunciations as being dialectal – specific origin. Social meanings tell us about the geographical or social background of the speaker.

Affective meanings reflect personal feelings of the speaker including the attitude to the listener or to the content of the talk (Leech, 1981). These are often explicitly conveyed through the conceptual or the connotative content of the words used. Social norms of politeness may vary from society to society.

3. Define thematic meaning?

Ans: Thematic meaning refers to the central or recurring idea that runs through a text, often reflecting its underlying message or purpose. It encompasses the main topics, subjects, or issues that the text explores, providing a unifying thread that ties together various elements. Thematic meaning helps readers or audiences understand the deeper significance and intended message of a piece of literature, film, or other forms of communication.

4. Define reflected and collocative meaning?

Ans: Reflected meanings are the meanings when we associate one sense of expression with another. Meaning which arises in cases of multiple conceptual meaning, when one sense of a word forms part our response to another sense (Leech, 1981).

Collocative meanings consist of the associations a word acquires on account of the meaning of words which tend to occur in its environment, e.g. ‘pretty’ and ‘handsome’ share the similar ground in the meaning, ‘good-looking’ but may be

distinguished by the range of nouns with which they co-occur or collocate. The collocative meaning may simply be an idiosyncratic property of individual words.

Chapter 6

1. Differentiate between sense and concept?

Ans: **Sense** places a new level between the words and the world: a level of mental representation. Thus, a noun is said to gain its ability to denote because it is associated with something in the speaker/hearer's mind. This is the relationship between the image and the real world entity would be then one of resemblance. Sense is variation in images that different speakers might have depending on their experience.

Concept might be able to contain the non-visual features, e.g. a definition of triangle, may include a 'three-sided polygon, classifiable by its angles or sides'. Describing some concepts might be simple and related to perceptual stimuli – e.g. sun, water, etc.

2. Define prototype?

Ans: In linguistics, a prototype is a cognitive representation or mental image that serves as the best example of a particular category. It is a central or most typical member of a category that individuals use to identify and classify other members of that category. Prototypes play a significant role in cognitive linguistics, where they are seen as the basis for category formation and language comprehension. They help explain how people categorize and understand the meanings of words based on their typical or core features. The concept of prototypes is often associated with cognitive models of categorization and prototype theory.

3. Linguistic relativity?

Ans: The notion of linguistic relativity, associated with Edward Sapir and Benjamin Lee Whorf, is an idea that has spread far outside the fields of anthropology and linguistics, where it began. One reason perhaps is that it provides an explanation for a common experience when dealing with different languages. Writers translating between languages have often remarked on the lack of fit between words in two languages, e.g. color words might not have exactly the same range in different languages. The fact that language mirrors cultural differences followed to the work of Franz Boas, an anthropologist.

Chapter 7

1. Difference between polysemy and homonymy?

Ans:

Polysemy	homonymy
Polysemy is identified using the criteria of —relatedness‖; when the senses are judged to be related under the same lexical entry.	Homonyms are unrelated senses of the same phonological words. Different types of homonyms can be distinguished by their syntactic behaviors and spelling.
Polysemy is a linguistic phenomenon where a single word has multiple meanings that are related by extension. Here are two examples of polysemy: 1. Bank: - Financial Institution: - River Bank: In this example, the word "bank" has two distinct meanings—one related to a	e.g. the verb 'ring' and 'wring' or, lexemes of the different syntactic category with same spellings e.g. the verb 'keep' and the noun 'keep' or, lexemes of the different syntactic category with different spellings e.g. not, knot.

financial institution and the other to the side of a river.

2. Differentiate between synonyms and antonyms?

Ans: Synonymy is the notion of sameness of meaning. According to Saeed (2014), synonyms are different phonological words which have the same or very similar meanings e.g. couch/sofa, boy/lad, lawyer/attorney.

Antonyms are words which are opposite in meaning. For example, "hot" and "cold" are antonyms because they represent opposite temperature states.

3. Write the types of antonyms?

Ans: 1. Simple Antonyms - the negative of one implies the positive of the other - complementary pairs or binary pairs.

2. Gradable Antonyms - this is a relationship between opposites where the positive of one term does not necessarily imply the negative of the other.

3. Taxonomy Sisters -antonym sometimes describe words which are at the same level in taxonomy. Taxonomies are classification systems e.g. the color adjectives in English (i.e. red, orange, yellow, green, blue, purple, brown).

4. Reverses - shows reverse relation in between terms describing movements, where one term describes movement in one direction, and the other the same movement in the opposite direction, e.g. push/pull, come/go, up/down, in/out, right/left.

5. Converses - describe a relation between two entities from alternate viewpoints, e.g. own/belong to, above/ below, employer/ employee.

Chapter 8

1. Define hyponymy?

Ans: Hyponymy is a relation of inclusion. It includes the meaning of a more general word. E.g. dog and cat are hyponyms of 'animal', sister and mother are hyponyms of 'woman'. The more general term is called superordinate. Much of the vocabulary is linked by such systems of inclusion, and the resulting semantic networks form the hierarchical taxonomies. Examples are the pairs: animal/dog, dog/poodle, vegetable/carrot, flower/rose, tree/banyan.

2. Define meronymy?

Ans: Meronymy is a term used to describe a part-whole relationship between lexical items, e.g. we can identify this relationship by using sentence frames like 'X is part of Y' or 'Y has X', as 'in a page is part of a book, or a book has pages'. Meronyms vary in three ways: First, how necessary the part is to the whole. e.g. nose as a meronym of the face. Others are usual but not obligatory, e.g. collar as a meronym of the shirt. Third are optional, e.g. cellar for the house. Meronymy differs from hyponymy in transitivity. Hyponymy is always transitive but meronymy may or may not be.

3. Difference between causative verb and agentive noun?

Ans: Causative verbs identify a relationship between an adjective describing a state and a verb describing a beginning or change of state (inchoative). For example, 'wide' as in 'the road is wide' and 'widen' as in 'the road widened' e.g. 'widen' as in 'the City Council widened the road'.

Agentive nouns have the meaning 'the entity who/which performs the action of the verb'. There are several types of agentive nouns. One well-known type is derived from verbs and ends in the written forms -er or -or, e.g. skier, walker, whaler, toaster, commentator, dictator, calculator.

4. Who present the concept of “color terms” ?

Ans: Berlin and Kay (1969) investigated that languages vary in the number and range of their basic color terms. To them, there are various ways of describing colors, including comparison to objects, languages have some lexemes which are basic in the following sense:

Firstly, the term is monolexemic, i.e. not build up from the meaning of its parts - the term bluegrey are not basic. Secondly, the term is not a hyponym of any other color, i.e. the color is not a kind of another color.

Thirdly, the term has wide applicability. This excludes terms like English blonde. Fourthly, the term is not a semantic extension of something manifesting that color. So turquoise, gold, taupe, and chestnut are not basic. English has eleven – white, black, red, green, yellow, blue, brown, purple, pink, orange, and grey – color terms in its system.

Chapter 9**1. Write a brief note on paradigmatic and syntagmatic relation?**

Ans: Paradigmatic relations hold between concepts belonging to the same grammatical category. These relations cover a wide variety of associations between words, including morphological and phonetic. For instance, in a ‘_red door’ and ‘_green door’, ‘_red’ and ‘_green’ are in a paradigmatic relation to each other.

A paradigm is a set of linguistic or other units that can be substituted for each other in the same position within a sequence or structure.

Syntagmatic relations hold between two or more words co-present in a sequence.

Combinations based on sequential relations are called syntagms. The notion of a syntagm applies among others to a group of words and to complex units of every size and kind, for example, phrases, sentences. For instance, in a ‘_red car’ and ‘_green car’, ‘_red’ and ‘_green’ are in syntagmatic relation with ‘_car’.

2. Difference between collocation and idioms?

Ans: A **collocation** is either a highly frequent co-occurrence of two or more words or a combination of words which represents a fully grammatical structure, e.g. a noun phrase. Collocation is a familiar grouping of words, especially words that habitually appear together and thereby convey meaning by association. Collocations also define a sequence of words or terms that co-occur more often than would be expected by chance. e.g., Strong tea is a correct expression and Powerful tea is considered as the wrong expression.

Idioms are expressions whose meaning cannot be inferred from the meaning of its parts. Usually, these are translated with semantically and not necessarily lexically equivalents in the target language. Majority of idioms are homophonous, such as ‘_by and large’ or ‘_far and away’

Chapter 10**1. Define the relation between logic and truth?**

Ans: The relationship between logic and truth is that logic provides a systematic framework for valid reasoning and inference, ensuring that conclusions follow from premises. While logic contributes to the internal consistency of arguments, the truth of statements also depends on their correspondence to reality. Logic, therefore, helps assess and preserve truth by guiding the process of sound reasoning and argumentation.

2. Define logic? Also write the types of logic?

Ans: In linguistics, logic refers to the systematic study of the structure and meaning of language. It involves analyzing the rules and principles governing the relationships between linguistic elements, such as words and sentences, to understand how meaning is conveyed. Logical analysis in linguistics helps unveil the underlying structures and patterns that enable effective communication within a language system.

Types: 1) propositional logic 2) predicate logic

1) propositional logic is also known as propositional calculus and sentential calculus. Here, we are concerned with the relations that hold between sentences, involving complex sentences, irrespective of the internal structure of the sentences themselves. For example, we have two sentences i.e. John is in his office and John is at home. Between them, one is true; if the second is false, it can be concluded that the first is true. This conclusion can be drawn irrespective of the form of the sentences themselves.

2) The study of the truth behavior of sentences with quantifiers e.g. all, every, each, some, one gave rise to predicate logic. The propositional logic cannot account for inferences that depend upon relations within sentences and cannot deal with an example such as All men are mortal, Socrates is a man, and therefore, Socrates is mortal.

3. Briefly explain "entailment" ?

Ans: Entailment defined by truth – —A sentence p entails a sentence q when the truth of the first (p) guarantees the truth of the second (q), and the falsity of the second (q) guarantees the falsity of the first (p). Let's take an example of the sentences below, where a is said to entail b: a. The anarchist assassinated the emperor. b. The emperor died.

4. Explain tarski's point about truth conditional semantic?

Ans: Tarski's (1956:155) definition is a true sentence is one which states that the state of affairs is so and so, and the state of affairs is so and so. For instance, Snow is white if and only snow is white. In fact, he proposed this as the basis of a theory of truth, but it is easy to see how it can be converted into a theory of meaning. At first, this dictum may seem to be completely uninformative. Of course, snow is white if snow is white.

Chapter 11

1. Explain two approaches of presupposition?

Ans: In the first approach, sentences are viewed as external objects. We do not worry too much about the process of producing them, or the individuality of the speaker or writer and their audience. Meaning is seen as an attribute of sentences rather than something constructed by the participants.

Second approach views sentences as the utterances of individuals engaged in a communication act. The aim is to develop the strategies that speakers and hearers use to communicate with one another. Thus, we might look at communication from the speaker's viewpoint. Presupposition is one of a number of inferences that the listener might make on the basis of what the speaker has just said. The first approach is essentially semantic and the second pragmatic.

2. Define presupposition failure with examples?

Ans: Presupposition failure is one phenomenon that caused problems for a truth relations approach. It has been observed that using a name or a definite description to refer, presupposes the existence of the named or described entity. Thus, the a sentence presupposes the b sentences in the following examples.

- a. Ronald is a vegetarian.
- b. Ronald exists.
- a. The King of France is bald.
- b. There is a King of France.

3. Explain presupposition triggers in 3-4 lines?

Ans: Presupposition triggers are the types of presupposition produced by particular words or constructions. Some of these triggers derive from syntactic structures. Many presuppositions are produced by the presence of certain words (lexical triggers) mostly _verbs_. For example, there is a class of verbs like _regret_ and _realize_ called factive verbs because they presuppose the truth of their complement clause.

Chapter 12

1. Define the following terms briefly: 1) tense 2) aspect ?

Ans: Tense is a category which allows a speaker to relate situations to time. For example, _they will cut the grass tomorrow_ is future tense.

Aspect System allows the speaker to relate situation and time, and to view an event in various ways: as complete or incomplete. Aspects have to do not with the location of an event in time, but with its temporal distribution or contour (Saeed, 2004). For example: _She is coming_ (incomplete), _She has come_ (complete).

2. Modality?

Ans: Modality is a linguistic category (like aspect or tense) that modifies the meaning of the event or action we talk about to include ways to —influence the event described. Modality may express what the speaker wants to do (give permission, describe ability, suggest, request, offer, prohibit, express desires or necessity, etc.) It also expresses whether the speaker believes, or is sure that what he or she is saying is true. There are two types of modality: Epistemic Modality expresses the degree of knowledge how sure the speaker is in his communication and Deontic Modality shows, where the verbs mark the speaker's attitude to social factors of obligation, responsibility, and permission.

3. Define "mood" and briefly explain its types?

Ans: Mood is the quality of verb which conveys a writer's attitude or feelings towards a subject (Saeed, 2004). Mood also shows the feelings of a speaker at time of speaking. For example, _it may rain tomorrow_. In this example, the speaker's attitude is uncertain about the rain.

There are different types of moods: □

1. **Indicative moods** express a fact, opinion, or question based on realist form.
2. **Potential moods:** The word _Potential_ stands for probability. So, potential moods may have specific verb ending. Conditional uses infinitives with auxiliary verbs such as have, be, should, etc. □
3. **Subjunctive moods** contrast with indicative moods because there is an element of uncertainty in subjunctive moods. These are used for wishes, beliefs, exhortations, etc. e.g. _May you live long!

Imperative moods make direct commands or requests. For example, _show me the money_.

4. Write the types of evidentiality?

Ans: There are different types of evidentiality: □

Witness Evidentiality: when an information source is obtained from the direct observation, e.g. _I saw him breaking the window_. It is usually visual information (Eyewitness) □

Sensory Evidentiality: indicates that the speaker's evidence for truth is derived from the speaker's own sensory experience. □ **Inferential Evidentiality:** Indicates that the speaker makes his/her statement based on a deduction from facts and not on a direct observation of the action itself. □

Reportative Evidentiality: Indicates that the information was reported to the speaker by another person. It can be quotes, rumour or a news report. □

An assumed evidential indicates that the information source is not based on a mere guess but is rather based on the general knowledge or habitual activities.

Chapter 13

1. Briefly explain the thematic roles?(agent, patient, theme , experience)

Ans: Agent is the initiator of some action, capable of acting with volition. For example, Rashid cooked the meat.

Patient is the entity/person undergoing the effect of the main action of a verb or undergoing some change in state, for example, John cut down these bushes.

Theme is the entity (person or thing) which is changed or moved by an action of a verb, or whose location is described by verb. For example, the book is in the library.

Experiencer is the entity which is aware of the action or state described by the predicate but which is not in control of the action or state. For example, Kamran heard the door shut.

2. Write the problems that face with thematic roles?

Ans: The first problem is really about delimiting particular roles. The extreme case would be to identify individual thematic roles for each verb: thus we would say that a verb like *beat* gives two theta-roles - a *beater* role and a *beaten* role. Second problem: how do we define theta-roles in general? That is, what semantic basis do we have for characterizing roles? Facing both these problems, Dowty (1991) proposes a solution where theta-roles are not semantic primitives but are defined in terms of entailment of the predicate.

3. Explain the thematic roles? ((Beneficiary, Instrument, Location, Goal, Source, Stimulus)

Ans: Beneficiary is the entity for whose benefit the action was performed. For example, they baked me a cake.

Instrument is the means by which an action is performed or something comes about. For example, I write a letter with the pen.

Location is the place where something is situated or has taken place. For example, the baby was hiding behind the curtain.

Goal is the entity towards which something is moved, either literally or metaphorically. For example, the driver handed his license to the policeman.

Source is the entity from which something moves, either literally or metaphorically. For example, I took the pen from the drawer.

Stimulus is the entity causing an effect (usually psychological) during an experience. For example: The noise of the horn frightened the passengers.

Chapter 14

1. How many categories fall in grammar?

Ans: Grammar is not restricted to the study of form or function words. It is concerned, more widely, with categories such as tense, gender, number and with syntactic functions such as subject and object, e.g. *Ali* (Noun/Subject, etc.). These categories

can be on _phrasal level' as well, e.g. _Ali the son of John' is a noun phrase. According to Palmer, there are two familiar grammatical categories, _Gender' and _Number' but English has strictly no grammatical gender at all. It has, of course, pronouns he, she, it but, these are essentially the markers of sex. Noun class of countable and uncountable, or count and mass. Examples of count nouns are a cat, a book, an apple, etc. Mass nouns may occur with no article or with some indefinite quantifiers. For example, some butter, some milk, little water etc

2. What do you mean by formal grammar?

Ans: Formal grammar is the study or the use of rules about how words change their form and combine with other words to express meaning (Cambridge Dictionary). This is a fact about English that sequence of sounds conveys meaning differently.

_Man' /mæn/ is singular grammatically and _Men' /men/ is plural grammatically.

Most of the traditional grammarians assumed that grammatical categories were essentially semantic. Some linguists argued that grammar must be distinct from semantics and grammatical categories must be wholly defined in terms of the FORM of the language.

3. Relation between grammar and lexicon?

Ans: The relationship between grammar and lexicon in linguistics is intricate and interdependent. Grammar encompasses the rules and structures governing the formation of sentences, while the lexicon comprises the vocabulary or set of words in a language. Together, they form the basis of a language system: grammar organizes how words combine to create meaningful expressions, and the lexicon provides the repository of individual words. Changes in one can influence the other, as modifications in grammar may lead to shifts in word usage, and new lexical items can prompt adjustments in grammatical structures. Ultimately, grammar and lexicon collaboratively shape the linguistic competence of speakers.

4. What is case grammar?

Ans: A system of grammatical description based on the functional relations that noun groups have to the main verb of a sentence (Collins Dictionary Online). Palmer has given three cases _Agentive, Instrumental and Object'. Fillmore has suggested six cases, _Agentive, Instrumental, Dative, Factitive, Locative, Objective.

Chapter 15

1. Explain model- theoretic semantic model?

Ans: Model-Theoretic Semantics Model is based on _what reality is like which is useful for semantic purposes' i.e. truth, falsity or inadmissible. Truth-conditions of sentences are defined in terms of a model of reality appropriate to how language works, with it being a further issue how that model relates to reality itself —intended model' and the —intended interpretation'.

2. Leech define the FIVE functions of language which play a major role in human society? Explain these functions?

Ans: Leech has given five functions of a language which play a major role in human society.

1. **Informational Function** is linked with the subject matter.

2. Expressive Function can be used to express its originator's feelings and attitudes.

3. **Directive Function;** we aim to influence the behavior or attitudes of others, e.g. commands and requests.

4. **Aesthetic Function** is for poetic expressions - the use of language for the sake of the linguistic artefact itself, and for no ulterior purpose, e.g. the message is often

conceptual as with effective meaning. In aesthetic function, both the poet and the reader bring a heightened sensitivity to bear on the act of communication.

5. Phatic Function is a function which keeps communication lines open, and keeps social relationships in good repair, e.g. _to show that intentions in communication are sincere and friendly, e.g. greetings, farewells, and routine polite questions.

3. Define associative and conceptual meaning that describe by leech?

Ans: According to Leech, the associative meaning of an expression has to do with individual mental understandings of the speaker.

Conceptual meanings are based on the idea that the speaker wants to deliver. Two dangers can arise if attitudes and emotions are conveyed by the associative meanings of words (Leech, 1981). One is _misconception and misunderstanding‘ because associative meanings tend to vary from person to person. The second danger is that if the affective meaning of the message predominates over the conceptual meaning, the listener or reader will not be able to understand what is being said.

Chapter 16

1. What is semantic competence?

Ans: „Semantic Competence“ is how a native speaker knows about lexical items to understand the meaning. Leech (1981) has used different terminologies for dictionaries such as: _Theoretical dictionaries, _flesh-and-blood dictionaries or practical dictionaries‘, such as the Concise Oxford Dictionary, compiled by lexicographers – we all consult regularly. It has been argued that the lexical definition, as part of the native speaker’s linguistic equipment, can be precisely represented only by a special formal language (Leech, 1981). But practical lexicographers cannot use this method of explanation, if they do, they would convey nothing to the average dictionary-users.

2. Write the types of lexical rules?

Ans: Major types:

Morphological derivation, conversion, and semantic transfer. Morphological derivation involves a change in the morphological specification. For example, the addition of an affix to the original morphological specification, which is called the base? Base= Base + Suffix (less).

Conversion is a change in the syntactic function (and usually the meaning) of an item without a corresponding change in morphological form. For example, _catch [verb] might have been changed into catch[noun].

Semantic transfer often designated metonymy in traditional terminology, for examples, _Neighborhood objected to his plans‘ and (Neighborhood=people in the neighborhood).

Chapter 17

1. Write a brief note on “pragmatics” ? explain types of pragmatics?

Ans: Pragmatics is concerned with —meaning in context (Chapman, 2011). It is the study of meaning as communicated by the speaker and interpreted by the listener. _It is the study of —invisible meaning, or how we recognize what is meant even when it isn’t actually said or written‘ (Yule, 2010).

According to Chapman (2005:11), Pragmatics can be divided into two types. First is **theoretical pragmatics** that concentrates on the analysis of particular aspects of meaning and how these might be explained within more general formal accounts of

language use. Second is **social pragmatics** which focuses on various aspects of the relationship between language use and more general social and cultural factors.

2. What are the subgroups that recognized the pragmatics?

Ans: 1. **Pragmalinguistics** - deals with the more linguistic end of the pragmatic spectrum. Usage is seen from the viewpoint of structural resources of a language, i.e. concerns aspects of context which are formally encoded in the structure of a language.

3. **Sociopragmatics** - see usage as primarily determined by social factors in communication.

3. **Applied pragmatics** - refers to practical problems of interaction in situations where successful communication is critical, e.g. medical interviews, law courts, interrogations, official counseling etc.

Chapter 18

1. Write down the development phenomenon of pragmatics?

Ans: Pragmatics is a relatively new branch of linguistics, research on it can be dated back to ancient Greece and Rome where the term *pragmaticus* is found in late Latin and *pragmaticos* in Greek, both meaning of being *practical*. Modern use and practice of pragmatics is credited to the American philosophical doctrine of pragmatism. The pragmatic interpretation of semiotics and verbal communication studies in *Foundations of the Theory of Signs* by Charles Morris (1938), for instance, helped to neatly expound the differences of mainstream enterprises in semiotics and linguistics.

2. Explain theory of sign that present by Charles Morris? OR Charles Morris's theory of sign?

Ans: Theory of Signs (1938) he distinguished between syntax, the study of the formal relations of signs to each other, semantics, the study of the meaning of signs in terms of the objects that they denote or might denote and pragmatics, *the science of the relation of signs to their users* (p. 29). He expanded on this in his *Signs, Language, and Behavior* (1946): pragmatics *deals with the origins, uses, and effects of signs within the total behavior of the interpreters of signs*.

3. Briefly explain the modern pragmatics?

Ans: The current state and recent history of pragmatics are too diverse and complex to describe briefly; A few areas of interest may be picked out. Early in the modern period, disagreement on the principles that govern communication led to fragmentation of the field into Griceans, Neo-Griceans and relevance theorists. There are also pragmatic theorists who work primarily on speech acts. From the 1970s, many theorists have been interested in developing formal accounts of phenomena, particularly scalar implicature, presupposition, and conventional implicature. This work is now known as formal pragmatics and has close links to dynamic approaches to semantics such as Discourse Representation Theory.
