1/8/2020 Solved BY:Muhammad Nadeem

BT201 Final Term MCQS PPTs (51--------70)

1. In _____the first really good system of invertebrates are assemble (1801)
2. _____realized life couldn't all be ordered in a single chain Lamarck
3. _____pushes" living things towards higher and higher positions on the chain evolution
4. The branches arise from adaptation to _____ local conditions
5. Evolution arises from an interaction between organism and_____ environment
6. Animals have trait _____ X
7. Why Animals have trait x?? Because x will serve their needs in that environment
8. Who identified four basic body plans for animals Lamarck
9. Who explored the unity of parts and their patterns of development St. Hilaire
10. _____proceeds up the tree of life Development
11. _____ were the developer of paleontology Smith, Buckland and Cuvier
12. Where do new species come from?
13. In this biosphere, the oceans contain _____of freshwater 97%
14. In this biosphere, the polar ice caps and glaciers contain _____of freshwater 2%
15. In this biosphere, the leaving contains less than _____of freshwater 1%
16. Chemical factors of biology of aquatic environments are _____ salinity and oxygen
17. Oceanic temperatures are much more stable than _____ Terrestrial temperatures
18. The open ocean supports large numbers of _____ species
19. Kelp forests are found mainly at_____ temperate latitudes
20. How many types of Coral reefs one of three
21. Seaweeds and reef-building corals grow only in _____waters surface
22. Kelp forests temperature ranges from about _____ 10° to 20℃,
23. Reef-building corals are limited to areas with temperatures of about_____ 18° to 29℃
24. The intertidal zone lines the _____of the world coastlines
25. The intertidal zone can be divided into _____vertical zones several
26. _____ are found mainly at temperate and high latitudes Salt marshes
27. _____grow in the tropics and subtropics Mangrove forests
28. _____are extremely dynamic physically, chemically, and biologically Estuaries
29. A few lakes contain most of the _____in the biosphere freshwater
30. _____environments are particularly vulnerable to the introduction of exotic species Freshwater
31. Studies of intraspecific competition provide evidence for resource _____ limitation
32. The _____reflects the environmental requirements of species niche
33. _____species with identical niches cannot coexist indefinitely Two
34. _____added the concepts of the fundamental niche Hutchinson
35. the niches of _____are largely determined by their feeding requirements Galapagos finches
36. the niche of a salt marsh grass can be defined by _____ tidal levels
37. _____independently expanded the logistic model of population growth to represent interspecific competition.
    Lotka and Volterra
38. _____can have significant ecological and evolutionary influences on the niches of species Competition

39. Theoretically, natural selection may lead to divergence in the niches of competing species, a situation called _____ character displacement
40. the validity of field experiments depends upon _____design — 4
41. the pathogen usually kills the host plant and always renders it sterile process called as____ — pseudoflowers
42. The herbivorous moth larva _____combined with pathogenic microbes — *Cactoblastis cactorum*
43. A parasitic infestation reduced the red fox population in Sweden by _____ — 70%
44. Predator-prey, parasite-host, and pathogenhost relationships are _____ — dynamic
45. Predators and parasites have been used to control populations of _____ — insects
46. Mutualism provides benefits to plants ranging from _____ — nitrogen fixation
47. ___percent of terrestrial plants form mutualistic relationships with mycorrhizal fungi — Ninety
48. ____are important in increasing plant access to water, nitrogen, phosphorus, and other nutrients — mycorrhizae or ectomycorrhizae
49. _____plants provide ants with food but not shelter in trade for protection — mutualistic
50. Mutualistic algae called _____ — zooxanthellae
51. _____graphed the abundance of species in collections — Frank Preston
52. Preston's graphs were approximately _____curves — "bell-shaped"
53. Preston's graphs are called as _____ — lognormal" distributions
54. A combination of the number of species and their relative abundance defines_____ — species diversity
55. _____major factors define the diversity of a community — Two
56. $H' = -\sum$ pi loge pi are the formula of _____ — Shannon-Wiener index
57. _____- discovered that five coexisting warbler species — Robert MacArthur (1958)
58. Intermediate levels of disturbance promote _____ — higher diversity
59. When did the Joseph Connell born & died — (1975, 1978)
60. _____ studied the effects of disturbance on the diversity of sessile marine algae — Wayne Sousa
61. Humans disturbed tropical rain forests in Central America beginning about ____years ago — 11,000
62. _____predicted that some predators may increase species diversity by reducing the probability of competitive exclusion — Robert Paine (1966)
63. _____predators can collapse and simplify the structure of food webs — Exotic
64. Humans have acted as _____species in communities — keystone
65. Chinese farmers have used ants as _____ — keystone predators
66. Full form of AET — Annual Actual Evapo Transpiration
67. Temperature and moisture conditions can be combined in a single measure called _____ — AET
68. _____can be used to trace the flow of energy through ecosystems — Stable isotope analysis
69. Primary forest succession around Glacier Bay may require about _____years — 1,500
70. secondary forest succession on the Piedmont Plateau takes about _____ years — 150
71. succession in the intertidal zone requires _____years — 1 to 3
72. The ability to bounce back after disturbance is called _____- — resilience
