Lampreys are _____.

Select the correct option

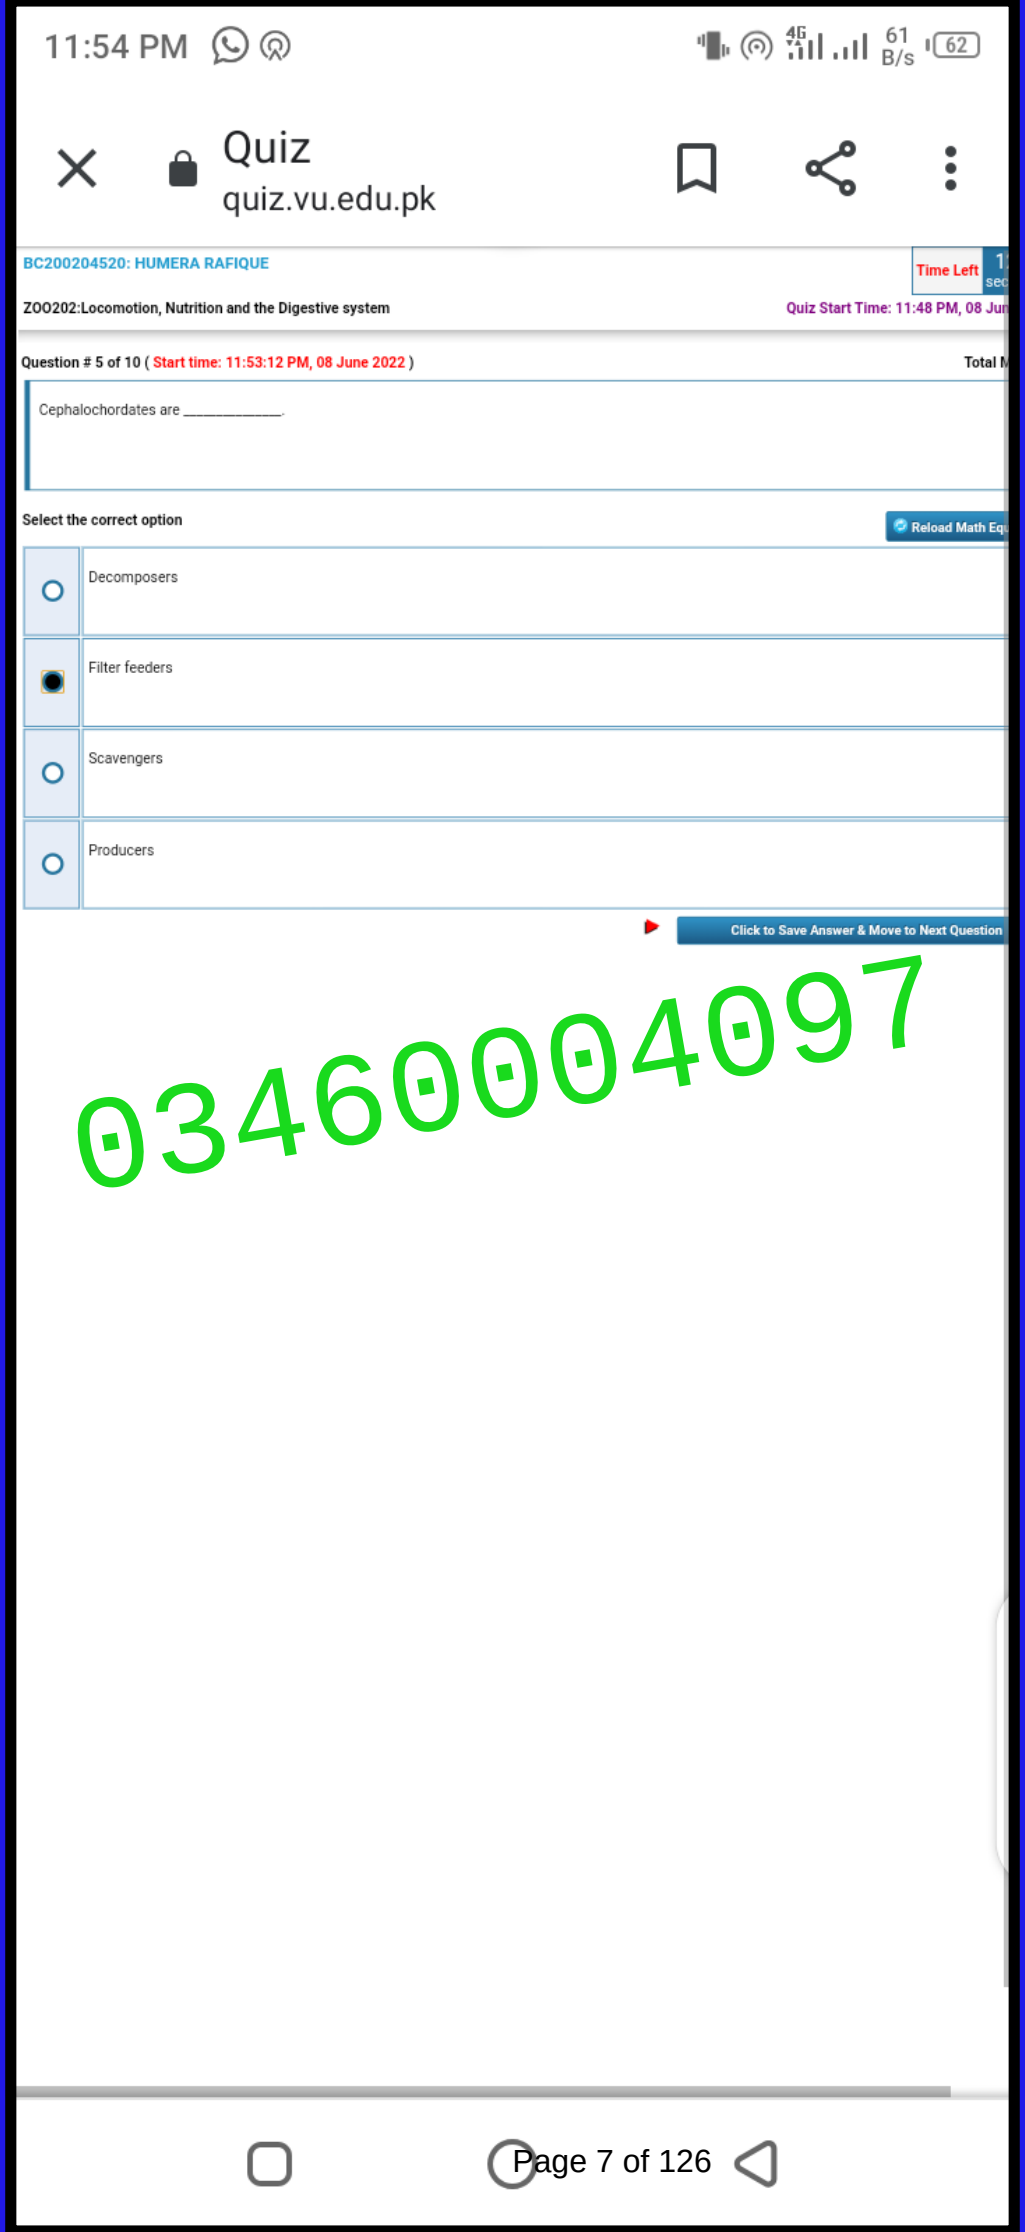

- Scavengers
- Carnivore
  Carnivore
  Carnivore
  carnivore
- External parasites
- Filter feeders

03460004097

- Teeth are for crushing the shells of molluscs or the exoskeletons of arthropods.
- Fishes often use the **suction** which develops a negative pressure
- **Herring, paddlefishes, and whale sharks** are filter feeders
- **Gill rakers**, trap plankton while the fish is swimming through the water
- **Carp** feed on a variety of plants and small animals.

- Lamprey, are external parasites for at least a portion of their lives.
- A few are primarily **herbivores**
- The fish **digestive tract** is similar to that of other vertebrates.
- **Stomach** stores large, often infrequent, meals.
- Primary site for enzyme secretion
- **Sharks** and other **elasmobranchs** have a **spiral valve**
- **Pyloric ceca** increase absorptive and secretory surfaces.

eat the contents of the body, leaving only a sack of skin and bones.

- Anglers must contend with hagfishes because they will bite at a baited hool
- Most zoologists now consider the hagfishes to be the most primitive group of vertebrates.

Hagfish external structure

Lesson 21

Agnathans: Cephalaspidomorphi

03460004097

Agnathans: Cephalaspidomorphi

Class Cephalaspidomorphi

- **Lampreys** are agnathans in the class Cephalaspidomorphi.
- They are common inhabitants of marine and freshwater environments in temperate regions.
- Most adult lampreys prey on other fishes, and the **larvae are filter feeders**.
- The mouth of an adult is sucker like and surrounded by lips that have sensory and attachment functions.
- Numerous epidermal teeth line the mouth and cover a movable tongue like structure.

- Adults attach to prey with their lips and teeth and use their tongues to rasp away scales.
- Lampreys have **salivary glands** with anticoagulant secretions and feed mainly on the blood of their prey.
- Some lampreys, however, are not predatory.
- Members of the genus Lampetra are called **brook lampreys**.
- The larval stages of brook lampreys last for about three years, and the adults neither feed nor leave their stream.
- They reproduce soon after metamorphosis and then die.

12:00 AM 284.5 K/s 60

shark 5 of 6

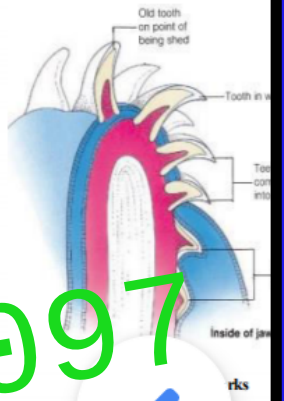

- These scales project posteriorly and give the skin a tough, sandpaper texture.
- In fact, dried shark skin has been used for sandpaper.
- Posteriorly pointed scales also reduce friction with the water as a shark swims

Section of shark skin

128-130 / 521

- Shark teeth are actually modified placoid scales.
- The row of teeth on the outer edge of the jaw is backed up by rows of teeth attached to a ligamentous band that covers the jaw cartilage inside the mouth.
- As the outer teeth wear and become useless, newer teeth move into position from inside the jaw and replace them.
- In young sharks, this replacement is rapid, with a new row of teeth developing every seven or eight days.

- The cephalochordates consist of two genera, **Branchiostoma (amphioxus)** and **Asymmetron**, and about 45 species.
- They are distributed throughout the world's oceans in shallow waters that have clean sand substrates.
- Cephalochordates are small **(up to 5 cm long),** tadpole like animals.
- They are elongate, laterally flattened, and nearly transparent.
- In spite of their streamlined shape, cephalochordates are relatively **weak swimmers**

- They spend most of their time in a filter feeding position partly to mostly buried with their anterior end sticking out of the sand
- The notochord of cephalochordates extends from the tail to the head
- Unlike the notochord of other chordates, most of the cells are muscular making the notochord somewhat contractile.

ZOO202:Locomotion, Nutrition and the Digestive system

Question # 10 of 10 (Start time: 02:10:48 PM, 09 June 2022)

In cephalochordates, food is initially stored in _____.

Select the correct option

- Crop
- Endo style
- Gizzard
- Cirri

03460004097

- This interpretation is mistaken, as these characteristics simply res from different adaptations in the two groups to similar selection p
- Tough skin with dermal, placoid scales covers sharks.
- These scales project posteriorly and give the skin a tough, sandpa texture.
- In fact, dried shark skin has been used for sandpaper.
- Posteriorly pointed scales also reduce friction with the water as a swims

03460004097

- Shark teeth are actually modified placoid scales.
- The row of teeth on the outer edge of the jaw is backed up by rows of teeth attached to a ligamentous band that covers the jaw cartilage inside the mouth.
- As the outer teeth wear and become useless, newer teeth move into position from inside the jaw and replace them.
- In young sharks, this replacement is rapid, with a new row of teeth developing every seven or eight days.

Question # 1 of 10 (Start time: 02:33:52 PM, 09 June 2022)

Sturgeons are valued for their _____.

Select the correct option

- Scales
- Fins
- Caviar
- Meat
