Reliability and Validity

- Existing statistics and secondary data are not trouble free. Researchers must be concerned about validity and reliability .
- A common error is the fallacy of misplaced concreteness. Someone gives a false impression of accuracy by quoting statistics in greater detail than warranted by how the statistics were collected.

Validity problems

- Researcher's theoretical definition may not match with government agency or organization that collected the data. *Unemployed*.
- Researcher lack control over how the data were collected. Data collection as part of job. No quality control – systematic errors. Typographical errors.

Reliability

- Stability reliability problems develop when official definition or method of collecting data changes over time.
- Definition of literacy changed many times. Definition of unemployment. Poverty.
- Equivalence reliability. Decimal system. Problems of comparability nationally and internationally.

Inferences from non-reactive data

- To infer causality and to test a theory on the basis of non-reactive data is limited.
- Cannot establish temporal order of variables. Cannot eliminate the interference of confounding factors.
- Not possible to generalize from content to its effects on those who read the text. Only logical correlation.

Communication analysis

- Analyzing the content of text.
- Content refers to words, meanings, pictures, symbols, ideas, themes, messages.
- Text is anything written, visual, or spoken
- Books, newspapers, advertisements, speeches, official documents, photographs, films, articles of clothing, works of art.

Case study

- In-depth analysis of a unit.
- Clinical analysis in retrospect.
- Multiple sources of information – history, consulting written records.

Focus group discussions

- Discussion of an issue by 6–12 persons assisted by a moderator.
- Useful in exploratory research. Supplements the quantitative information.

No one method is best

- Researchers evaluate and select the most appropriate method.

7. Data collection, data processing and analysis

- Integral part of research design.
- Variety of ways. Field and lab.
- Interviews, questionnaires, observation.
- Data processing – editing, coding, computer entries, tabulation.

8. Testing the Hypotheses

- Interpretation of data.
- Testing the hypotheses.
- Finding solutions to problems of organization or society.
- Making recommendations

9. Report Writing

- Communicating the research findings.
- Report is technical. Managers are selective readers. Interested only in recommendations.
- Historical document.
- Academic purpose – dissertations. Specific format. Writing of research papers

46. Case Study Research

What is **case study** research?

- Study of an issue explored through one or more cases within a bounded system over time, through detailed, in-depth data collection involving multiple sources of information
- it as a methodology, a type of design in qualitative research, or an object of study, as well as a product of the inquiry.
- Espouses both quantitative and qualitative approaches to **case study** development and discusses explanatory, exploratory, and descriptive qualitative case studies.

Types of case studies:

- In **single instrumental case study**, the researcher focuses on an issue or concern, and then selects one bounded case to illustrate this issue.
- In **collective/multiple case study**, the one issue or concern is again selected, but the inquirer selects multiple case studies to illustrate the issue.
- In **intrinsic case study**, focus is on the case itself because the case presents an unusual or unique situation.

Procedures for conducting a **case study**:

- First, researchers determine if a **case study** approach is appropriate to the research problem
- Researchers next need to identify their case or cases
- The data collection in **case study** research is typically extensive, drawing on multiple sources of information
- The type of analysis of these data can be a holistic analysis of the entire case or an embedded analysis of a specific aspect of the case.
- the researcher reports the meaning of the case, whether that meaning comes an instrumental case or an intrinsic case

Challenges:

- The **case study** researcher must decide which bounded system to study
- The researcher must consider whether to study a single case or multiple cases.
- Selecting the case requires that the researcher establish a rationale for his or her purposeful sampling strategy for selecting the case and for gathering information about the case.

Narrative research

- "Narrative is understood as a spoken or written text giving an account of an event/action or series of events/actions, chronologically connected".
- The procedures for implementing this research consist of focusing on studying one or two individuals, gathering data through the collection of their stories, reporting individual experiences, and chronologically ordering (or using life course stages) the meaning of those experiences.

Types of narrative research

- 1. A biographical study is a form of narrative study in which the researcher writes and records the experiences of another person's life.
- 2. Autobiography is written and recorded by the individuals who are the subject of the study.
- 3. A life history portrays an individual's entire life, while a personal experience story is a narrative study of an individual's personal experience found in single or multiple episodes, private situations, or communal folklore.
- 4. An oral history consists of gathering personal reflections of events and their causes and effects from one individual or several individuals.

Procedures for Conducting Narrative Research

1. Determine if the research problem or question best fits narrative research. Narrative research is best for capturing the detailed stories or life experiences of a single life or the lives of a small number of individuals.

2. Select one or more individuals who have stories or life experiences to tell, and spend considerable time with them gathering their stories through multiple types of information.

3. Collect information about the context of these stories. Narrative researchers situate individual stories within participants' personal experiences (their jobs, their homes), their culture (racial or ethnic), and their historical contexts (time and place).

4. Analyze the participants' stories, and then "restore" them into a framework that makes sense. Restoring is the process of reorganizing the stories into some general type of framework.

5. Collaborate with participants by actively involving them in the research. As researchers collect stories, they negotiate relationships, smooth transitions, and provide ways to be useful to the participants.

Challenges

- The researcher needs to collect extensive information about the participant, and needs to have a clear understanding of the context of the individual's life.
- It takes a keen eye to identify in the source material gathered the particular stories that capture the individual's experiences.
- Active collaboration with the participant is necessary, and researchers need to discuss the participant's stories as well as be reflective about their own personal and political background, which shapes how they "restore" the account.
- Multiple issues arise in the collecting, analyzing, and telling of individual stories.

iii. **Null** Hypothesis:

- No relationship between the variables
- The relationship between the variables is “zero”
- **Null** hypothesis is denoted as H_0
- H_0 = No relationship between X and Y /
- H_0 = X and Y are independent of each other.

- H_0 is non directional.

Use of **Null** Hypothesis:

- Used for testing the research hypothesis
- Researchers give more importance to negative evidence. No relationship rather than a relationship i.e. **Null** hypothesis.
- Reject H_0 and accept alternative.

iv. Alternative Hypothesis:

- It is alternative to H_0 .
- There is a perfect relationship between X and Y i.e. H_1

v. Research Hypothesis:

- This is the hypothesis formulated by the researcher.
- Tells not only the relationship but also the nature of relationship between X and Y.

The Role of Hypothesis:

- It guides the direction of study
- It identifies facts that are relevant and those that are not.
- It suggests which form of research design is likely to be the most appropriate.
- It provides framework for organizing the conclusions of findings the conclusions of findings.

The Characteristics of a Testable Hypothesis:

- Hypothesis must be conceptually clear.
- Hypothesis should have empirical referents.
- Hypothesis must be specific.
- Hypothesis should be related to available techniques of research.
- Hypothesis should be related to a body of theory

Phenomenology

- A *phenomenological study* describes the meaning for several individuals of their *lived experiences* of a concept or a phenomenon.
- The basic purpose of **phenomenology** is to reduce individual experiences with a phenomenon to a description of the universal essence.

Types of Phenomenology

- Two approaches to **phenomenology** are highlighted in this discussion:
 - Hermeneutic **phenomenology**
 - Empirical, transcendental, or psychological **phenomenology**
 - Hermeneutical **phenomenology** describes research as oriented toward lived experience (**phenomenology**) and interpreting the "texts" of life (hermeneutics) as available in blogs and tweets etc.
- Transcendental or psychological **phenomenology** is focused less on the interpretations of the researcher and more on a description of the experiences of participants.

Procedures for Conducting Phenomenological Research

1. The researcher determines if the research problem is best examined using a phenomenological approach. The type of problem best suited for this form of research is one in which it is important to understand several individuals' common or shared experiences of a phenomenon
2. A phenomenon of interest to study, such as anger, professionalism, what it means to be underweight, or what it means to be a wrestler, is identified.
3. Data are collected from the individuals who have experienced the phenomenon. Often data collection in phenomenological studies consists of in-depth interviews and multiple interviews with participants. . Other forms of data may also be collected, such as

MUHAMMAD IMRAN

91

observations, journals, art, poetry, music, taped conversations, formally written responses, accounts of vicarious experiences of drama, films, poetry, novels and other forms of art.

4. The participants are asked two broad, general questions: What have you experienced in terms of the phenomenon? What contexts or situations have typically influenced or affected your experiences of the phenomenon? Other open-ended questions may also be asked.
5. *Phenomenological data analysis* steps are generally similar for all psychological phenomenologists. Building on the data from the first and second research questions, data analysts go through the data (e.g., interview transcriptions) and highlight "significant statements," sentences, or quotes that provide an understanding of how the participants experienced the phenomenon.
6. The significant statements and themes are used to write a description of what the participants experienced (*textural description*). They are also used to write a description of the context or setting that influenced how the participants experienced the phenomenon, called *imaginative variation* or *structural description*.
7. From the structural and textural descriptions, the researcher then writes a composite description that presents the "essence" of the phenomenon, called the *essential, invariant structure (or essence)*. Primarily this passage focuses on the common experiences of the participants

Challenges

- **Phenomenology** requires at least some understanding of the broader philosophical assumptions, and these should be identified by the researcher.
- The participants in the study need to be carefully chosen to be individuals who have all experienced the phenomenon in question, so that the researcher, in the end, can forge a common understanding.
- *Bracketing* personal experiences may be difficult for the researcher to implement.
- An interpretive approach to **phenomenology** would signal this as an impossibility for the researcher to become separated from the text.

Steps in Field Research

Background

- Flexibility: naturalism and direct involvement demand researcher flexibility. Researcher himself/herself has to be flexible. No fixed steps to be followed.
- Good field researchers recognize and seize opportunities. Rapidly adjust.

1. Prepare yourself, read the literature, and defocus. Empty your mind. No stereotypes.

- Field project → some happening or personal interest. Generic topic (No hypothesis)
Literature will help in learning concepts, methods, techniques for resolving conflicts.
- Not purely focusing on the role of researcher. Has to have experience.
- Know yourself. No preconceptions about self and others. Can you bear the strains.

2. Select a field site and gain access.

- Where to observe? Site: socially defined territory with shifting boundaries.
- Gain access. Look for gate keepers. Authority. May have to negotiate. Entry may be a process – use access ladder. Building trust helps in having access to observe sensitive events.

3. Enter the field and establish social relations with members.

- Develop rapport.
- Presentation of self. Acceptable to people.
- Researcher as measuring instrument. Has to be alert to happenings around. Maintain social relationships and personal feelings.

4. Relations in the field

- Adopt a social role, learn the ropes, and get along with members.

MUHAMMAD IMRAN

72

- Preexisting versus created roles. Limits to the roles chosen because of age, race, gender, attractiveness.
- Also the level of involvement. Complete observer, observer as participant, participant as observer, complete participant.

5. Observing and collecting data

- Watch, listen, and collect quality data.
- Field data are what the researcher experiences, remembers, and records in field notes.
- Maps and diagram. Machine recording

6. Begin to analyze data, generate and evaluate working hypothesis.

- Field research does not start with a hypothesis. Could be generated from the data.

7. Focus on specific aspects of the setting and use theoretical sampling.

- Researcher first gets general picture. Develops hypothesis. Then focuses on few specific problems.
- Take smaller, selective observations. Takes theoretical sampling. Guided by researcher's own theory. Sample times, situations, types of events, locations, types of people.

8. Conduct field interviews with member informants.

- Field researchers use unstructured, nondirective, in-depth interviews which differ from formal survey research interviews.

Rights of the **participants**

- No physical harm, discomfort, pain, embarrassment, or loss of privacy.

Follow three guidelines:

1. Explain study benefits.
2. Explain respondent rights and protections.
3. Obtain informed consent.

Benefits

- Discuss the study's benefits.
- Can be part of establishing rapport.
- Further inducements to participate. Should not be used as coercive measure.
- Note that sometime actual purpose is concealed just to avoid the bias. This deception.

b. **Descriptive** Research:

- Research designed to describe characteristics of the phenomenon under study.
- Helps in diagnostic analysis

Goals of **Descriptive** Research:

- Describe the situation/characteristics. Provide an accurate profile of a group.
- Give a verbal or numerical picture (%).
- Present basic background information.
- Create a set of categories or classify.
- Clarify sequence, set of stages.
- Focus on 'who', 'what', 'when', 'where' and 'how' but not on 'why'.

c. Explanatory Research:

- Also called as causal research i.e.
- 'Why'? Explanation.
- Identify cause and effect relationship among different factors.

Goals of Explanatory Research:

- Explain things not just reporting. Why?
- Which explanation is better.
- Determine the accuracy of theory.
- Advance knowledge about underlying process
- Build and elaborate a theory → complete.
- Extend a theory or principle into new areas.
- Provide evidence to support *or* refute an explanation or prediction.

2. Intended Uses of Research:

a. Basic Research

- Pure/ fundamental/ academic
- Developing/ refuting/ supporting theories.
- Expand knowledge.
- Explanatory research is the most common
- Applied can also contribute.

FR Interview vs. Survey Interview

Survey Interview

1. It has clear beginning and end.
2. The same standard questions are asked of all respondents in the same sequence.
3. The interviewer appears neutral at all times.
4. The interviewer asks questions, and the respondent answers.
5. It is almost always with one respondent alone.
6. It has a professional tone and businesslike focus, diversions are ignored.
7. Closed-ended questions are common, with rare probes.
8. The interviewer alone controls the pace and direction of interview.
9. The social context in which the interview occurs is ignored and assumed to make little difference.

Field Interview

1. The beginning and end are not clear. The interview can be picked up later.
2. The questions and the order in which they are asked are tailored to specific people and situations.
3. The interviewer shows interest in responses, encourages elaboration.
4. It is like a friendly conversational exchange but with more interviewer questions.
5. It can occur in group setting or with others in area, but varies.
6. It is interspersed with jokes, aside, stories, diversions, and anecdotes, which are recorded.
7. Open-ended questions are common, and probes are frequent.
8. The interviewer and member jointly control the pace and direction of the interview.
9. The social context of the interview is noted and seen as important for interpreting the meaning of responses.

46. Case Study Research

What is **case study** research?

- Study of an issue explored through one or more cases within a bounded system over time, through detailed, in-depth data collection involving multiple sources of information
- it as a methodology, a type of design in qualitative research, or an object of study, as well as a product of the inquiry.
- Espouses both quantitative and qualitative approaches to **case study** development and discusses explanatory, exploratory, and descriptive qualitative case studies.

Types of case studies:

- In **single instrumental case study**, the researcher focuses on an issue or concern, and then selects one bounded case to illustrate this issue.
- In **collective/multiple case study**, the one issue or concern is again selected, but the inquirer selects multiple case studies to illustrate the issue.
- In **intrinsic case study**, focus is on the case itself because the case presents an unusual or unique situation.

Procedures for conducting a **case study**:

- First, researchers determine if a **case study** approach is appropriate to the research problem
- Researchers next need to identify their case or cases
- The data collection in **case study** research is typically extensive, drawing on multiple sources of information
- The type of analysis of these data can be a holistic analysis of the entire case or an embedded analysis of a specific aspect of the case.
- the researcher reports the meaning of the case, whether that meaning comes an instrumental case or an intrinsic case

Challenges:

- The **case study** researcher must decide which bounded system to study
- The researcher must consider whether to study a single case or multiple cases.
- Selecting the case requires that the researcher establish a rationale for his or her purposeful sampling strategy for selecting the case and for gathering information about the case.

What is grounded theory?

Grounded Theory is an inductive methodology. It is a systematic methodology in the social sciences involving the construction of theory through the analysis of data.

to move beyond description and to generate or discover a theory, an abstract analytical schema of a process

It is the systematic generation of theory from systematic research. It is a set of rigorous research procedures leading to the emergence of conceptual categories.

Thus, **grounded theory** is a qualitative research design in which the inquirer generates a general explanation (a theory) of a process, action, or interaction shaped by the views of a large number of participants (Strauss & Corbin, 1998).

Types of **grounded theory** studies:

- The two popular approaches to **grounded theory** are the systematic procedures of Strauss and Corbin (1990, 1998) and the constructivist approach of Charmaz (2005, 2006).
- In the more systematic, the investigator seeks to systematically develop a theory that explains process, action, or interaction on a topic.
- Charmaz's approach is known as the constructivist grounded theory method as it adheres to a constructivist philosophical approach, wherein both the researcher and participants mutually co-construct meaning during data collection and analysis.

Procedures for conducting **grounded theory** research

- The researcher needs to begin by determining if **grounded theory** is best suited to study his or her research problem.
- The research questions that the inquirer asks of participants will focus on understanding how individuals
- experience the process and identifying the steps in the process
- These questions are typically asked in interviews, although other forms of data may also be collected, such as observations, documents, and audiovisual materials.
- The analysis of the data proceeds in stages.
- In axial coding, the investigator assembles the data in new ways after open coding.
- Finally, the researcher may develop and visually portray a conditional matrix that elucidates the social, historical, and economic conditions influencing the central phenomenon.
- The result of this process of data collection and analysis is a theory, a substantive-level theory, written by a researcher close to a specific problem or population of people.

Challenges:

A **grounded theory** study challenges researchers for the following reasons:

- The investigator needs to set aside, as much as possible, theoretical ideas or notions so that the analytic, substantive theory can emerge.
- The researcher faces the difficulty of determining when categories are saturated or when the theory is sufficiently detailed.
- The researcher needs to recognize that the primary outcome of this study is a theory with specific components: a central phenomenon, causal conditions, strategies, conditions, context, and consequences.

Difference between cross sectional and longitudinal studies 5

Cross-Sectional Studies are carried out once and represent a snapshot of one point in time. Data are collected just once, perhaps over a period of days or weeks or months, in order to answer the research question.

Longitudinal Studies are repeated over an extended period. The advantage of longitudinal studies is that it can track changes over time. For example, the researcher might want to study employees' behavior before and after a change in the top management, so as to know what effects the change accomplished. Here, because data are gathered at two different points in time, the study is not cross-sectional or of the one-shot kind, but is carried longitudinally across a period of time. Such studies, as when data on the dependent variable are gathered at two or more points in time to answer the research question, are called longitudinal. Longitudinal studies can be *panel studies* and *cohort*

Enlist parts of main body of report 3

Main Body

The main body constitutes the bulk of the report. It includes: Introduction, Methodology, Results, Conclusions, and Recommendations of the study.

Introduction: The introduction prepares the reader for the report by describing the parts of the project

background material, the problem statement, and research objectives of the study. In most projects, introduction can be taken from the research proposal submitted earlier by the consultant. The proposal itself was based on the terms of reference (TOR) supplied by the client.

Background could help in looking at the magnitude of the problem. It may include the results of exploration from an experience survey, focus group discussion, and secondary data from literature

review. The background includes definitions, qualifications and assumptions. It gives the reader the information needed to understand the remainder of research report.

Problem statement contains the need for the research project. The problem is usually represented by the research question raised by the client. It explains why the project was worth doing.

Research objectives address the purpose of the project. These objectives may be research questions and associated investigative questions. In correlational or causal studies, the hypothesis statement may be included. At the end of the study the researcher may see the extent to which these objectives have been addressed.

Difference between ethnography and phenomenology 3

Although a phenomenology emphasizes the meaning of an experience for a number of individuals, the intent of a *grounded theory study* is to move beyond description and to *generate or discover a theory*, an abstract analytical schema of a process (or action or interaction, Strauss & Corbin, 1998). Participants in the study would all have experienced the process, and the development of the theory might help explain practice or provide a framework for further research. A key idea is that this theory-development does not come "off the shelf," but rather is generated or "grounded" in data from participants who have experienced the process (Strauss & Corbin, 1998). Thus, grounded theory is a qualitative research design in which the inquirer generates a general explanation (a theory) of a process, action, or interaction shaped by the views of a large number of participants (Strauss & Corbin, 1998).

Ethnography:

An *ethnography* focuses on an entire cultural group. Granted, sometimes this cultural group may be small (a few teachers, a few social workers), but typically it is large, involving many people who interact over time (teachers in an entire school, a community social work group). Ethnography is a qualitative design in which the researcher describes and interprets the shared and learned patterns of values, *behaviors*, beliefs, and language of a *culture-sharing group* (Harris, 1968).

A theoretical framework is conceptual model of how one theorizes or makes logical sense of the relationships among several factors that have been identified as important to the problem under study. These factors which may also be called as variables may have been identified through such processes as interviews with informants, observations, and literature survey. The theoretical framework discusses the interrelationships among the variables that are considered to be integral to the dynamics of the situation being investigated..

The Components of the Theoretical Framework

A good theoretical framework identifies and labels the important variables in the situation that are relevant to the problem identified. It logically describes the interconnections among these variables.

The relationships among the independent variables, the dependent variable(s), and if applicable, the moderating and intervening variables are elaborated.

The elaboration of the variables in the theoretical framework addresses the issues of why or how we expect certain relationships to exist, and the nature and direction of the relationships among the variables of interest. At the end, the whole discussion can be portrayed in a schematic diagram. There are six basic features that should be incorporated in any theoretical framework. These features are:

1. **Make an inventory of variables:** For developing a framework it appears essential to identify the factors relevant to the problem under study. These factors are the empirical realities which can be named at some abstract level called concepts. The concepts taking more than one value are the variables. In other words, the researcher makes *an inventory of relevant variables*. The variables considered relevant to the study should be clearly identified and labeled in the discussion.
2. **Specify the direction of relationship:** If the nature and direction of relationship can be theorized on the basis of the findings of previous research, then there should be an indication in the discussion as to whether the relationship should be positive or negative.
3. **Give a clear explanation of why we should expect the proposed relationships to exist.** There should be clear explanation of why we would expect these relationships to exist. The arguments could be drawn from the previous research findings. The discussions should state how two or more variables are related to one another. This should be done for the important relationships that are theorized to exist among the variables. It is essential to theorize logical relationship between different variables.
4. **Make an inventory of propositions:** Stipulation of logical relationship between any two variables means the formulation of a proposition. If such relationships have been proposed between different variables, it will result in the formulation of a number of propositions. Let us call such a collection of propositions as *an inventory of propositions*. Each proposition is backed up by strong theoretical argumentation.
5. **Arrange these propositions in a sequential order:** one proposition generates the next proposition, which generates the next following proposition, which in turn generates the next following proposition, and so on. This is an axiomatic way of the derivation of propositions. Resultantly it will provide us a sequentially arranged set of propositions which are interlinked and interlocked with each other. Theory, if you remember, is an interrelated set of propositions. Therefore, the present interrelated set of propositions relevant to a particular problem is in fact a theoretical framework explaining the pathways of logical relationships between different variables.
6. **Schematic diagram of the theoretical model be given:** A schematic diagram of the theoretical framework should be given so that the reader can see and easily comprehend the theorized relationships.

Difference between cross sectional and longitudinal studies?

Longitudinal studies differ from one-off, or **cross-sectional, studies**. The main difference is that **cross-sectional studies** interview a fresh sample of people each time they are carried out, whereas **longitudinal studies** follow the same sample of people over time.

Write the procedure of implementation in your own words?

Challenges in implementing case study?

The difficulties associated with the implementation of the case-study method as a pedagogic tool. To ensure the validity of the sources are most of them are peer reviewed, which is an accepted method in the scientific community. This method ensures that the information is correct and that the conclusions of the source has been audited and accepted by an independent peer **(Internet)**

Difference between participant observation and non-participant observation?

Participant Observation • Participant observation is immersion in a culture. Ideally, the ethnographer lives and works in the community for six months to a year or more, learning the language and seeing patterns of behaviour over time. Long-term residence helps the researcher internalize the basic beliefs, fears, hopes and expectations of the people under study. (1989:45)

Nonparticipant Observation • Interviewing is trying to understand what people think through their speech. • Types of interviewing: • informal interviewing, • unstructured interviewing, • semi-structured interviewing, and • formally structured interviewing.

Differentiate between narrative research and phenomenological research?

Narrative research • "Narrative is understood as a spoken or written text giving an account of an event/action or series of events/actions, chronologically connected". • The procedures for implementing this research consist of focusing on studying one or two individuals, gathering data through the collection of their stories, reporting individual experiences, and chronologically ordering (or using life course stages) the meaning of those experiences.

A **phenomenological** study describes the meaning for several individuals of their lived experiences of a concept or a phenomenon. • The basic purpose of phenomenology is to reduce individual experiences with a phenomenon to a description of the universal essence.

How can we categorized descriptive statistics give example?

Descriptive statistics are brief descriptive coefficients that summarize a given data set, which can be either a representation of the entire or a sample of a population. Descriptive statistics are broken down into measures of central tendency and measures of variability (spread). For example, it would not be useful to know that all of the participants in our example wore blue shoes. ... Central tendency describes the central point in a data set. Variability describes the spread of the data

Different qualitative and quantitative research with example?

Qualitative research

To gain an in-depth understanding and explanation of some particular social phenomenon

The data collection is done by interviewing; however, an understanding of the social phenomenon and personal lived experiences of individuals might be gained via non-intrusive qualitative approaches in which there searcher might use texts, journals, written narratives or observations.

Quantitative research

Quantitative research, on the other hand, explores descriptive analysis of characteristics through variables or answers questions about the relationships among variables.

Emnurate the part of main body of reseach report?

1. Introduction
2. Background
3. Objectives
4. Methodology.

What points should one keep in mind while putting other research work done in table?

1. Give each table a number.
2. Give each table a title.
3. Label the row and column variables, and give name to each of the variable categories.
4. Include the totals of the columns and rows. These are called as marginal.
5. Each number or place that corresponds to the intersection of category for each variable is cell of a table.
6. Missing information to be given under the table

What is running record?

Files or existing statistical documents maintained by organizations. Vital statistics.

Explain participant and non-participant observation study?

Participant observation is immersion in a culture. Ideally, the ethnographer lives and works in the community for six months to a year or more ,learning the language and seeing patterns of behavior over time.

Non-participant observation involves merely watching what is happening and recording events on the spot.

Enlist 5 qualitative research John W Creswell in his book?

Five qualitative research methods are discussed in this subject as discussed by John W. Creswell in his book. Following are the five qualitative research methods:

1. Narrative Research.
2. Phenomenology
3. Grounded Theory.
4. Ethnography.
5. Case Study

Explain function of record in focus group?

Keep a record of the content as well as emotional reactions and nature of group interactions.

Record the following:

- Date, time, and place.
- Names and characteristics of participants.
- Description of group dynamics

3 Marks Questions

Difference between survey interview and field research interview?

Survey Interview: It has a clear beginning and end. • The same standard questions are asked and in same sequence. • Interviewer appears neutral at all times. Interviewer asks questions, and the respondent answers. • It is almost always with one respondent alone. Professional tone and business like focus; diversions ignored. • Closed ended Qs are common; rare probes. • Interviewer controls the pace and direction of interview. Social context of interview is ignored and assumed to make no difference. • Interviewer attempts to mold the communication in a standard

Define historiography?

Historiography is the study of the methods of historians in developing history as an academic discipline, and by extension is anybody of historical work on a particular subject.

Explain validity of secondary data?

Secondary data generally have a pre-established degree of validity and reliability which need not be re-examined by the researcher who is re-using such data. ... Secondary data can provide a baseline for primary research to compare the collected primary data results to and it can also be helpful in research design.

Challenges in implementing case study?

The difficulties associated with the implementation of the case-study method as a pedagogic tool. To ensure the validity of the sources are most of them are peer reviewed, which is an accepted method in the scientific community. This method ensures that the information is correct and that the conclusions of the source has been audited and accepted by an independent peer (Internet)

What are the limitations of focused group discussion?

Observe verbal as well non-verbal communication. What are they saying? What does it mean to them? Empathize. □ Do not try to comment on everything that is said □ Control the timings unobtrusively. □ Summarize the main issues at the end of FGD. □ Check whether all participants agree. □ Thank the participants. □ Listen for the ~~add~~ comments after meeting has closed.

Difference between cross sectional and longitudinal studies?

Longitudinal studies differ from one-off, or **cross-sectional**, studies. The main difference is that **cross-sectional studies** interview a fresh sample of people each time they are carried out, whereas **longitudinal studies** follow the same sample of people over time.

Write the procedure of implementation in narrative research?

1. Determine if the research problem or question best fits narrative research. Narrative research is best for capturing the detailed stories or life experiences of a single life or the lives of a small number of individuals.
2. Select one or more individuals who have stories or life experiences to tell, and spend considerable time with them gathering their stories through multiple types of information.
3. Collect information about the context of these stories. Narrative researchers situate individual stories within participants' personal experiences (their jobs, their homes), their culture (racial or ethnic), and their historical contexts (time and place).
4. Analyze the participants' stories, and then "restore" them into a framework that makes sense. Restoring is the process of reorganizing the stories into some general type of framework.
5. Collaborate with participants by actively involving them in the research. As researchers collect stories, they negotiate relationships, smooth transitions, and provide ways to be useful to the participants..

Differentiate between quantitative research and qualitative research?

Quantitative research:

Quantitative research, on the other hand, explores descriptive analysis of characteristics through variables or answers questions about the relationships among variables. • Quantitative research studies generally end with a summation of the verification process, which is a confirmation or disconfirmation of the hypotheses tested via deductive reasoning. • Conclusively, the aim of qualitative research is discovery, while the aim of quantitative research is verification

Qualitative research: To gain an in depth understanding and explanation of some particular social phenomenon. The data collection is done by interviewing; however, an understanding of the social phenomenon and personal lived experiences of individuals might be gained via non-intrusive qualitative approaches in which the researcher might use texts, journals, written narratives or observations. • Qualitative research questions begin with "How?" and/or "Why?" questions, but can begin with a "What?" question as well.

What points should be kept in mind while presenting a table to one's research?

Typically, these images are too small, too detailed and too textual for an effective visual presentation. The same is true for font size; 12 point font is adequate when the text is in front of you. In a slideshow, aim for a minimum of 40 point font. Remember the audience and move the circle from "me" to "we." (Internet)

What is focus group discussion? write the purpose of FGD?

The purpose of FGD: ☐ To obtain in-depth information on concepts, perceptions, and ideas of the group. ☐ More than a question-answer interaction. ☐ Group members discuss the topic among themselves.

Difference between scale and index?

Scale is a measure to capture the intensity, direction, level, or potency of a variable. Arranges responses on a continuum. A scale can use single indicator or multiple indicators. Ordinal level.

Index is a measure in which researcher adds or combines several distinct indicators of a construct into a single score. Composite score.

Define historiography?

Historiography is the study of the methods of historians in developing history as an academic discipline, and by extension is anybody of historical work on a particular subject.

Explain validity of secondary data?

Secondary data generally have a pre-established degree of validity and reliability which need not be re-examined by the researcher who is re-using such data. ... Secondary data can provide a baseline for primary research to compare the collected primary data results to and it can also be helpful in research design.

How can we categorized descriptive statistics give example?

Descriptive statistics are brief descriptive coefficients that summarize a given data set, which can be either a representation of the entire or a sample of a population. Descriptive statistics are broken down into measures of central tendency and measures of variability (spread). For example, it would not be useful to know that all of the participants in our example wore blue shoes. ... Central tendency describes the central point in a data set. Variability describes the spread of the data.

Different qualitative and quantitative research with example?

Qualitative research

To gain an in-depth understanding and explanation of some particular social phenomenon

The data collection is done by interviewing; however, an understanding of the social phenomenon and personal lived experiences of individuals might be gained via non-intrusive qualitative approaches in which the researcher might use texts, journals, written narratives or observations.

Quantitative research

Quantitative research, on the other hand, explores descriptive analysis of characteristics through variables or answers questions about the relationships among variables.

Enumerate the part of main body of research report?

1. Introduction
2. Background
3. Objectives
4. Methodology.

What is focus group discussion?write the purpose of FGD?

The purpose of FGD: ☐ To obtain in-depth information on **concepts**, perceptions, and ideas of the group. ☐ More than an question-answer interaction. ☐ Group members discuss the topic among themselves.

Difference between survey interview and field research interview?

Survey Interview: It has a clear beginning and end. • The same standard questions are asked and in same sequence. • Interviewer appears neutral at all times. Interviewer asks questions, and the respondent answers. • It is almost always with one respondent alone. Professional tone and business like focus; diversions ignored. • Closed ended Qs are common; rare probes. • Interviewer controls the pace and direction of interview. Social context of interview is ignored and assumed to make no difference. • Interviewer attempts to mold the communication in a standard framework.

FR Interview: The beginning and end are not clear. • Questions and order are tailored to specific people and situations. • Interviewer shows interest in responses, encourages elaboration. It is like a friendly conversational exchange, with more interviewer questions. • It can occur in group setting or with others in area. Interspersed with jokes, stories, diversions. • Open ended Qs are common; probes frequent. • Interviewer and member jointly control the pace and direction of interview. Social context of interview is noted and seen as important for interpreting the meaning or responses. • Interviewer adjusts to member's norms and language usage.

Enlist 6 features of theoretical framework?

1. Make an inventory of variables
2. Specify the direction of relationship
3. Logic for the proposed relationship
4. Make an inventory of propositions
5. Arrange propositions sequentially
6. Present schematic diagram

Enlist 6 features of theoretical framework?

1. Make an inventory of variables
2. Specify the direction of relationship
3. Logic for the proposed relationship
4. Make an inventory of propositions
5. Arrange propositions sequentially
6. Present schematic diagram

Enlist parts of main body of report?

□ Introduction: □ -- Background □ -- Objectives □ Methodology. □ Results ◇ can be divided into different areas. □ Limitations. □ Conclusions and recommendations □ References. □ Acknowledgements.

Appended parts □ Data collection forms (questionnaires, check list, interview guide, other forms). □ Detailed calculations. □ General tables. □ Other support material. □ Bibliography, if needed. **(may be this one right)**

Difference between ethnography and phenomenology?

Phenomenology: A phenomenological study describes the meaning for several individuals of their lived experiences of a concept or a phenomenon. □ The basic purpose of phenomenology is to reduce individual experiences with a phenomenon to a description of the universal essence.

Ethnography: Ethnography is a qualitative design in which the researcher describes and interprets the shared and learned patterns of values, behaviors, beliefs, and language of a culture-sharing group (Harris, 1968). □ Ethnography focuses on an entire cultural group which may be small, but typically it is large, involving many people who interact over time □ 'ethnography involves extended observations of the group, most often through participant observation.

Different qualitative and quantitative research with example?**Qualitative research**

To gain an in-depth understanding and explanation of some particular social phenomenon

The data collection is done by interviewing; however, an understanding of the social phenomenon and personal lived experiences of individuals might be gained via non-intrusive qualitative approaches in which there searcher might use texts, journals, written **narratives** or observations.

Quantitative research

Quantitative research, on the other hand, explores descriptive analysis of characteristics through variables or answers questions about the relationships among variables.

Emnurate the part of main body of reseach report?

1. Introduction
2. Background
3. Objectives
4. Methodology.

What points should one keep in mind while putting other research work done in table?

1. Give each table a number.
2. Give each table a title.
3. Label the row and column variables, and give name to each of the variable categories.
4. Include the totals of the columns and rows. These are called as marginal.
5. Each number or place that corresponds to the intersection of category for each variable is cell of a table.
6. Missing information to be given under the table

What is running record?

Files or existing statistical documents maintained by organizations. Vital statistics.

Explain participant and non-participant observation study?

Participant observation is immersion in a culture. Ideally, the ethnographer lives and works in the community for six months to a year or more ,learning the language and seeing patterns of behavior over time.

Non-participant observation involves merely watching what is happening and recording events on the spot.

Enlist 5 qualitative research John W Creswell in his book?

Five qualitative research methods are discussed in this subject as discussed by John W. Creswell in his book. Following are the five qualitative research methods:

1. **Narrative** Research.
2. Phenomenology
3. Grounded Theory.
4. Ethnography.
5. Case Study

Write the procedure of implementation in narrative research?

- 1. Determine if the research problem or question best fits narrative research. Narrative research is best for capturing the detailed stories or life experiences of a single life or the lives of a small number of individuals.
- 2 . Select one or more individuals who have stories or life experiences to tell, and spend considerable time with them gathering their stories through multiples types of information.
- 3. Collect information about the context of these stories. Narrative researchers situate individual stories within participants' personal experiences (their jobs, their homes), their culture (racial or ethnic), and their historical contexts (time and place).
- 4. Analyze the participants' stories, and then "restore" them into a framework that makes sense. Restoring is the process of reorganizing the stories into some general type of framework.
- 5. Collaborate with participants by actively involving them in the research. As researchers collect stories, they negotiate relationships, smooth transitions, and provide ways to be useful to the participants..

Differentiate between quantitative research and qualitative research?

Quantitative research:

Quantitative research, on the other hand, explores descriptive analysis of characteristics through variables or answers questions about the relationships among variables. • Quantitative research studies generally end with a summation of the verification process, which is a confirmation or disconfirmation of the hypotheses tested via deductive reasoning. • Conclusively, the aim of qualitative research is discovery, while the aim of quantitative research is verification

Qualitative research: To gain an in depth understanding and explanation of some particular social phenomenon. The data collection is done by interviewing; however, an understanding of the social phenomenon and personal lived experiences of individuals might be gained via non-intrusive qualitative approaches in which the researcher might use texts, journals, written narratives or observations. • Qualitative research questions begin with "How?" and/or "Why?" questions, but can begin with a "What?" question as well.

What points should be kept in mind while presenting a table to one's research?

Typically, these images are too small, too detailed and too textual for an effective visual presentation. The same is true for font size; 12 point font is adequate when the text is in front of you. In a slideshow, aim for a minimum of 40 point font. Remember the audience and move the circle from "me" to "we." (Internet)

What is focus group discussion?write the purpose of FGD?

The purpose of FGD: ☐ To obtain in-depth information on concepts, perceptions, and ideas of the group. ☐ More than an question-answer interaction. ☐ Group members discuss the topic among themselves.

Write the procedure of implementation in narrative research?

1. Determine if the research problem or question best fits narrative research. Narrative research is best for capturing the detailed stories or life experiences of a single life or the lives of a small number of individuals.
- 2 . Select one or more individuals who have stories or life experiences to tell, and spend considerable time with them gathering their stories through multiples types of information.

Challenges in implementing case study?

The difficulties associated with the implementation of the case-study method as a pedagogic tool. To ensure the validity of the sources are most of them are peer reviewed, which is an accepted method in the scientific community. This method ensures that the information is correct and that the conclusions of the source has been audited and accepted by an independent peer (Internet)

What are the limitations of focused group discussion?

Observe verbal as well non-verbal communication. What are they saying? What does it mean to them? Empathize. ☐ Do not try to comment on everything that is said ☐ Control the timings unobtrusively. ☐ Summarize the main issues at the end of FGD. ☐ Check whether all participants agree. ☐ Thank the participants. ☐ Listen for the ~~add~~ comments after meeting has closed.

Main body of report?

☐ Introduction: ☐ -- Background ☐ -- Objectives ☐ Methodology. ☐ Results ☐ can be divided into different areas. ☐ Conclusions and recommendations ☐ Acknowledgements. ☐ Limitations ☐ References.
Constitutes the bulk of the report. It includes: Introduction, methodology, results, and limitations of the study. It finishes with conclusions and recommendations based on results.

What is focus group discussion? write the purpose of FGD?

The purpose of **FGD**: ☐ To obtain in-depth information on concepts, perceptions, and ideas of the group. ☐ More than a question-answer interaction. ☐ Group members discuss the topic among themselves.

Long 10 Marks

Role of recorder in FGD 10 marks

Functions of the Recorder

- ☐ Keep a record of the content as well as emotional reactions and nature of group interactions.
- ☐ Record the following: -
 - Date, time, and place. –
 - Names and characteristics of participants.
 - Description of group dynamics (level of participation, presence of a dominant participant, level of interest).
 - Opinions of the participants, as far as possible in their own words, especially the key statements. –
 - Emotional aspects (reluctance, strong feelings attached to certain opinions). –
 - Vocabulary used.
- ☐ Assist the facilitator by drawing his/her attention to missed topics or missed comments from the participants. Help the facilitator resolve the conflict if necessary. Make sure a copy of the list of topics and key probe questions is available and referred to during the **FGD**.
