IMP MCQs

1. Using effective and suitable **software applications**, CALL can provide communicative meaningful language learning environments.

2. In traditional CALL, the methodology was often claimed to be based on a **behaviouristic** approach as in “programmable teaching”,

3. BBC computer, Apple II, and IBM PC, began to increase in the **early 1980s**.

4. In the field of CALL, we study about the language teaching and learning process by **using Computers**.

5. MUDs were originally developed in **1978 by Roy Trubshaw**.

6. **A computer** is ideal for carrying out repeated drills, since the machine does not get bored with presenting the same material and since it can provide immediate **non-judgmental** feedback.

7. The learner was allowed to enter and explore documentary-style depictions of reality in the city of Paris in **À la rencontre de Phillippe** a CALL application.

8. In 1980s, the language teachers not only played a role in **developing** CALL material rather also get involved in using them effectively with students.

9. The first computers used for language learning were large **1950s** main-frames that were only available at university campus research facilities.

10. The large 1950s main-frames first computers used for language learning were only available at **University's research facilities**.

11. Learners retain language knowledge or skills longer, make deeper associations and learn more of what they need is considered in **learning effectiveness** perspective of CALL operation.

12. BBC computer, Apple II, and IBM PC are the examples of **micro-computer** introduced in the early 1980s.

13. Gale (1989) describes **Macario** as an early videodisc program for learning Spanish.

14. **A Computer** is ideal for carrying out repeated drills, since the machine does not get bored with presenting the same material and since it can provide immediate non-judgmental feedback.

15. The student follows the course of a film in Macario and cannot vary from it so Macario is essentially **a linear** program.

16. In computer world www stands for **world wide web.**

17. In the game **Montevidisco.** the videodisc introduces a plaza where the learner is confronted by a local citizen.

18. Montevidisco, a simulation for learning Spanish, were developed during 1980s was the example of **random-access laser videodisc**.

19. However, despite greater user-friendliness, and effectiveness, CALL will never replace the **teachers**.

20. Among the first significant applications for the teaching/learning of language at the computer were those used on the **PLATO** system, developed **in 1959** by the University of Illinois.

21. CALL allows **learners** to control their own learning process and progress.

22. **In 1980s,** the language teachers not only played a role in developing CALL material rather also get involved in using them effectively with students.

23. The main aim of CALL is to find ways for using **computers** for the purpose of teaching and learning the language.

24. One of the great advantages **of email** over some other forms of communication is the record of both one's own messages and the messages one receives.

25. The study of the processes through which learners acquire a new **language** is known as **Second** Language Acquisition.

26. In terms of CALL, Krashen describes optimal input for acquisition as having a characteristic that it is **Comprehensible**.

27. Before 1980s there used to be only one way for learners to correct spelling on their own: using a **dictionary**.

28. In CAT, if a learner answers a question correctly, the computer will ensure that the next question will be more **difficult**.

29. WWW resources are considered as CALL **application**.

30. Collie and Slater's (1987) observations on the link between language learning and literature were written with reference to traditional paper-based learning materials they also hold true for **computer**-based learning materials.

31. CMC refers to a situation in which **computer**-based discussion may take place but without necessarily involving learning.

32. The corpus in **corpus** linguistics refers to a body of **text.**

33. Most educational games make use of a form of **subversive** teaching; learners are unaware of the objectives or, rather, do not share the same objectives as the teacher.

34. The theory which provides the rationale for a variety of marketable, yet short-lived teaching devices is called **Behaviorist** theory according to E.G. Rozycki.

35. The study of the processes through which learners acquire a new language is known as **second** Language Acquisition.

36. Communicating using the computer is often referred to as **computer-mediated communication (CMC)** and is one of the more popular activities associated with CALL.

37. The corpus in the Corpus Linguistics refers to a body of **text.**

38. In terms of CALL, the optimal input for acquisition is not **grammatically** sequenced.

39. A database of questions to match the **difficulty** of each test item to the abilities of the learners being tested. Is used by Computer Adaptive Testing.

40. Bloom, Hastings and Madaus in 1971 and Carrollin 1963 proposed that **Mastery learning** is based on the assumption that learning is a function of time.

41. In CAT, if a learner answers a question correctly, the computer will ensure that the next question will be more **difficult.**

42. British National Corpus is an example of **Corpus linguistics**.

43. The advantage of bulletin boards over email is that the messages are shared with a **broader** community and comment can be more considered as readers have more time.

44. A database of questions to match the difficulty of each test item to the abilities of the learners being tested. Is used by **Computer-Adaptive** Testing.

45. Bulletin boards on which learners can post messages to be read later by others are built into CALL environments and more general learning platforms such as **Blackboard Vista**.

46. Pre-planning a curriculum by breaking a content area into assumed component parts – 'skills' – and then sequencing these parts into a hierarchy ranging from simple to more complex is a concept presented by **C.T. Fosnot**.

47. One of the practical applications of the behaviorist approach is the design of programmed instruction or programmed learning on which **Skinner's** behaviorist contributions to CALL center.

48. The interactional work done by speakers and listeners to ensure they have a common understanding of the ongoing meanings of the discourse is known as **Negotiation of meaning**.

49. A humanistic model that suggests that learning is a process by which learners construct new ideas or concepts by making use of their own knowledge and experiences is known as **Constructivism**.

50. CMC refers to a situation in which **computer**-based discussion may take place but without necessarily involving learning.

51. R. Ellis proposed that the **Comprehensible input** refers to the language which learners are exposed to.

52. **G.P. Landow** on the advantages of hypertext as a **tool** for learning connectiveness in literature.

53. Traditional measurement of language learning depends on teacher observations and **tests**.

54. **Digital** means that the core data can be broken down into **strings of binary numbers: ones and zeros**.

55. It is within the area of **Process** variables that the sharpest differences between Dunkin and Biddle's model and a CALL model are apparent.

56. In 1984, Apple Computer introduced a new style of computer, the **Macintosh**.

57. Li (2006) conducted a study which looked at **264 students** at **3 junior** high schools.

58. When making **use** of a CALL program, learners need to determine what they know and what they do not know.

59. The way to classify materials is through the creation of in-house reviews, similar to book reviews, which outline key aspects of the program is known as **personalized**.

60. Computers inherently allow for a greater learner **autonomy** because, unlike a teacher, they are available beyond the time and space confines of the classroom.

61. it is increasingly common for teachers to use existing tools and platforms such as **Blackboard Vista** to create **new courses with interactive tasks** using **assessment software such as Responds and Question mark Perception**.

62. The criterion of **authenticity** indicates the need to develop learners' willingness to communicate.

63. If **CALL** software packages are to be properly evaluated and matched with learning needs, they need to be classified by teachers.

Subjective

Five types of CALL activities?

1) computer-assisted classroom discussion
2) a micro-world
3) text analysis
4) storyboard
5) concordancing.

what does the 'model of CALL' mean. Explain OR Models of CALL??

The Model of CALL (Computer-Assisted Language Learning) means a theoretical framework that explains how technology is used to support language learning, what the role of computer/teacher/learner is, and what learning approach it follows.

The major CALL models include **Behavioristic CALL**, based on drills and repetition where the computer works like a tutor giving right/wrong feedback; **Communicative CALL**, which promotes meaningful interaction, problem-solving, and task-based communication through tools like discussion boards, chats, or language games; and **Integrative CALL**, which blends real-world digital media with multiple language skills using authentic resources such as podcasts, videos, online research, or presentations.

Write 3 strategies of focused of CALL task?

1) Pre-task planning and modelling by teacher
2) Task-based focus on linguistic form during interaction

3) Post-task reflection and feedback on language use

Explain working of bulletin board? OR advantages of bulletin boards?

Bulletin boards allow learners and teachers to post messages that others can read later. Unlike email, posts are visible to a wider community, and users have more time to think before responding. Active discussions on a bulletin board can sometimes resemble a chat line if multiple people reply quickly.

Advantages:

1) The advantage of bulletin boards over email is that the messages are shared with a **broader** community and comment can be more considered as readers have more time.
2) Visual Learning
3) Encourages Participation
4) Helps organize information
5) Motivation and Inspiration
6) Easy Communication

Write a note on word processing?

Word processing programs help students write more easily by checking their spelling so they can focus on expressing their ideas. They also support learning new words, as students can look up meanings, see related words, and sometimes view helpful pictures. Grammar checkers suggest corrections, but not all suggestions are always correct, so students need to think carefully. Overall, word processors make writing, editing, and learning language easier and more effective. There used to be only one way for learners to correct spelling on their own: **using a dictionary**.

Beyond word processing, software such as Microsoft Word is increasingly multi-purpose. For example, it is commonly used by teachers (and some-times learners) for creating semi-authentic learning materials featuring text, tables and illustrations as well as simple websites. word-processing programs do not record misspellings or give any feedback to learners interested in reviewing their errors. Even worse, spelling checker programs allow learners to add new words to standard dictionaries and sometimes these words are themselves misspellings.

Mastery learning (C.T. Fosnot)?

This view says that big skills can be broken into smaller sub-skills. Learners are tested to find what they need, taught those parts, and checked again until they master each level. When mastery is achieved in all small skills, the overall concept is considered learned.

Write five characteristics of virtual classroom?

1) **Non-Restricting** - Students and teachers from anywhere in the world can join live online classes and interact.
2) **Affordable** - It saves money and time since there's no need for travel only an internet connection is required.
3) **Flexible Learning** – Classes can be recorded so students can re-watch them anytime if they missed something.
4) **Practical and Proven** – Online classes can be live just like traditional lectures but with added tools and ease
5) **Accessible** – Virtual classrooms support lectures, group work and meetings making learning and sharing ideas easy anytime and anywhere.

Problems of developing CALL program? OR Difficulties in creating call models?

1) Broad/expansive scope of CALL definition

- CALL is defined very widely as: "any process where a learner uses a computer and improves language", which makes modeling and development hard.

2) Need to decide and limit key variables

- Developers must make decisions about which classroom CALL aspects to include, and which to exclude (e.g., home use), otherwise the model becomes impractical.

3) Peripheral problems in CALL materials

- CALL initially suffered from: lack of funds, lack of expertise, lack of suitable tools/authoring programs, creating difficulties in developing a suitable model or full program.

What is CALL?

Computer-Assisted Language Learning (CALL) is defined as "the search for and study of applications of the computer in language teaching and learning." (Levy, 1997: 1) The main aim of CALL is to find ways for using **computers** for the purpose of teaching and learning the language.

Sharan and Shachar (1988) cognitive strategies?

1) Explain with evidence
2) Generalize
3) Organize ideas
4) Present a hypothesis or idea
5) Repeat
6) Repeat with expansion

The first CALL programs three pioneering institutions?

- Stanford University
- Dartmouth University and
- the University of Essex (The Scientific Language Project)

all focused on the teaching of Russian although, eventually, other languages were included as well (see Ahmad et al., 1985 for a summary).

Learning base computer games?

Learning-based computer games can help with language learning though the benefits may be small if the game isn't focused on a clear educational goal. However, the best educational games are designed in a way that makes students feel like they are just playing even though they are learning something important. These games hide the teaching goals within fun activities so learners stay engaged. For example, a teacher in Japan shared that his students enjoyed a grammar drill so much they thought it was a game.

What are the four main justifications for the use of literature in the language classroom of Collie and Slater (1987)?

1) valuable authentic material
2) cultural enrichment
3) language enrichment
4) personal involvement.

They also note the place of non-fictional authentic materials, such as bus schedules.

What do you know about Judgmental evaluation?

Judgmental evaluation refers to evaluating CALL tasks by carefully examining the software and the teacher-planned tasks before learners use them. It uses guiding questions to judge whether the task is well-designed, meaningful, and suitable for learning. This evaluation focuses on both what the software provides and what the teacher adds to the task.

How Lack of Funds Create Problems?

The Athena Language-Learning Project (ALLP) was a rare case that received over 70 million US dollars in funding. Most other projects get very little funding and many teachers create learning software on their own without any funding. Because of this teacher are often careful and do not take big risks since they might not get any return for their time and effort. Over time, computers have become cheaper and more powerful, and tools for making pictures, videos, and animations are now easy to buy.

Lack of funds creates problems in CALL development because early CALL programs require specialized software, authoring tools, hardware, and trained experts, all of which are costly. Without financial support, institutions struggle to purchase appropriate technological tools, hire or train skilled personnel, and maintain learning centers or online platforms, resulting in poorly designed or incomplete CALL materials.

Explain how schema theory provides an idea of how knowledge is organized?

Schema theory explains how knowledge is stored and organized in our minds through mental frameworks called schemata. These patterns help us understand new information by connecting it to what we already know. For example, when we read or listen to something, we use our background knowledge (schemas) to guess meanings and make sense of what's happening. In CALL this helps explain how learners process and understand language using their existing knowledge

Write the Call applications name?

1) Word processing
2) Games
3) Literature
4) Corpus linguistics
5) Computer-mediated communication (CMC)
6) WWW resources
7) Adapting other materials for CALL
8) Personal Digital Assistants (PDAs) and mobile telephones

Write a note on Macario?

Gale (1989) describes Macario as an early videodisc program for learning Spanish. It was developed at Brigham Young University and was an attempt to create learning materials by adapting existing materials, in this case a feature-length commercial video. It used a commercial movie and added educational features like annotations, questions, and footnotes to teach listening and language skills. Students could pause or play the video to answer questions and responses were given in Spanish. This method was cheaper than making new videos and used authentic materials from native speakers. Macario is essentially a **linear program.** In some ways, this approach is similar to creating a literary study guide, but differs in that the focus is on language learning, particularly the para-linguistic aspects. Each scene of the Macario video was given annotations, footnotes, questions and/or comments.

Hypertext in literature reading writing?

Hypertext allows students to link texts and multimedia showing how ideas are connected. It is flexible and helps learners explore literature in a more interactive way. Using hypertext can also

support language learning by encouraging students to make their own connections between ideas and materials.

features of multimedia?

Multimedia is a combination of text, images, sound, animation, and video delivered through a computer. When users can control how and when they see these elements it becomes interactive multimedia. If the elements are linked so users can navigate between them it is called hypermedia. In education, multimedia is used for **computer-based training (CBT),** digital reference books, and edutainment, helping students learn in more engaging ways.

Features:

- Interactivity
- Uses authentic digital resources (audio, video, web etc.)
- Encourages deep interaction and negotiation of meaning
- User Engagement
- Combination of Multiple Media
- Non-linear Navigation
- Integration

Table of principles for evaluating CALL?

Principle	Implication
Evaluation of CALL is a situation Specific argument.	CALL developers need to be familiar with criteria for evaluation which should be applied relative to a Particular context.
CALL should be evaluated through two perspectives: judgmental analysis of software and planned tasks, and empirical analysis of learners' performance.	Methodologies for both types of analyses are needed
Criteria for CALL task quality should come from theory and research on instructed SLA.	CALL evaluators need to keep up with and make links to research on instructed SLA.
Criteria should be applied in view of the purpose of the task.	CALL tasks should have a clearly articulated purpose.
Language learning potential should be the central criterion in evaluation of CALL.	Language learning should be one aspect of the purpose of CALL tasks.

Online games?

massively multiplayer online games (MMOGs) such as World of Warcraft. Online games are digital games that are played over the internet. Online games in CALL fall under the multimedia

feature of enabling meaningful interaction, authentic digital engagement, and higher-order thinking through Bloom's taxonomy while learners retain locus of control.

3 judgmental evaluations by teacher activity task?

1) Teachers should judge software and tasks by using criteria based on theories of good second language learning.
2) They must also know how to apply these criteria through a clear evaluation method.
3) Finally, these criteria and methods should be used not only for software but also for the classroom tasks teachers design and learners complete

Three objects for evaluation which are considered at three levels of analysis? OR Levels of analysis for CALL evaluation? OR three ways evaluation the software used in CALL Classroom?

1) CALL software (Its Method of analysis evaluation is Judgmental)
2) Teacher-planned CALL activities (Its Method of analysis evaluation is Judgmental)
3) Learners' performance during CALL activities (Its Method of analysis evaluation is Empirical)

Note on Montevidisco and Interactive Dígame?

Interactive Dígame was an early type of computer-based language learning program. Unlike traditional video lessons like Macario where students simply watch a fixed video and can't make choices, Interactive Dígame allowed more interaction and flexibility. The program included video scenes that showed real-life situations. After watching these scenes students were expected to talk about what they saw but not just by themselves the teacher would guide a classroom discussion in the target language (for example Spanish). This made the video not just something to watch but a starting point for communication and learning.

In Montevidisco, the videodisc introduces a plaza where the learner is confronted by a local citizen. The citizen speaks and then the video frame freezes and presents several choices of response. Based on the selected response, approximately 1,100 branching choices allow the learner to pursue different links or lines of enquiry. Each choice presents different links/opportunities for learning and only through repeating the program several times can all the choices and language opportunities be fully exploited.

Non-verbal aspects of collaboration?

Non-verbal aspects of collaboration are the ways people communicate and work together without using words, through gestures, actions, or body language. In collaborative learning students often communicate without words like pointing at the screen, sharing the keyboard, or handing over the mouse. These actions show teamwork and coordination.

Write a short note describing the pedagogical concern for using computer in classroom practice?

Pedagogical concerns for using computers in the classroom focus on making sure CALL activities help real learning, not just simple drills. Tasks should be meaningful, interactive, and allow learners to work together and control their own learning. Many CALL programs say they support collaboration, but sometimes they only give very basic teamwork, so teachers must choose tasks that require real communication and understanding. CALL use should follow a clear teaching approach and match the right level of thinking skills, so students can develop language and critical thinking. Teachers must guide students, help them analyze digital materials, and ensure the activities support real language use instead of shallow tasks.

Write the ways in which educationalist can conceptualized the field of CALL?

- Computer as tutor
- Computer as tool
- An evolving field
- A continuum between approaches

How is the "comprehensible input" explained by *R. Ellis*?

he input refers to the language which learners are exposed to. This can be ‘comprehensible’ (i.e. input that they can understand) or ‘incomprehensible’ (i.e. input that they cannot understand). When native speakers speak to L2 learners, they frequently adjust their speech to make it more comprehensible. Access to comprehensible input may be a necessary condition for acquisition to take place.

However, Ellis (1994) notes that Krashen did not see comprehensible input coming from other learners, ‘Interaction also provides learners with the opportunity to talk in the L2. According to Krashen (1985), this has no direct effect on acquisition.

Artificial intelligence?

In early CALL projects some developers tried to use artificial intelligence (AI) to make learning more interactive. Even though the AI was not fully developed these projects still produced interesting materials. One famous example is A la rencontre de Philippe an interactive drama where learners play a character searching for an apartment in Paris. Besides academic projects many commercial software companies also created CALL programs. Some became very successful such as:

- **Auralog (1987)** known for the Tell Me More series
- **Fairfield** Language Technologies (1992) creator of Rosetta Stone

These programs used technology to help learners practice language in more realistic and engaging ways.

Write a brief note on Random-Access Laser Videodisc?

In the 1980s the random-access laser videodisc became an important new technology in language learning. It allowed learners to instantly jump to any video segment which made lessons more interactive. This marked the early beginning of multimedia education. During this period projects like Montevidisco were created to teach Spanish through video-based simulation. One of the biggest projects ever in language teaching was MIT's Athena Language Learning Project which tried to combine interactive videodiscs with artificial intelligence to create a new kind of language learning experience.

write down the five questions addressed for the Empirical evaluation of the quality of "Learner fit" of CALL task? OR Questions for the empirical evaluation of CALL tasks?

Empirical evaluation means checking how well a CALL activity works by collecting real evidence from learners. Instead of guessing what learners are doing, teachers observe their actual behavior during CALL tasks. This evaluation uses data such as learner actions, performance, and responses to see whether the CALL activity truly supports learning. It helps identify what benefits are actually happening.

Qualities	Questions
Language learning potential	What evidence suggests that the learner has acquired the target forms that were focused on during the CALL task? What evidence indicates that learners focused on form during the CALL task?
Learner fit	What evidence suggests that the targeted linguistic forms are at an appropriate level of difficulty for the learners? What evidence suggests that the task is appropriate to learners' individual characteristics (e.g., age, learning style, computer experience)?
Meaning focus	What evidence suggests that learners' construction of linguistic meaning aids language learning? What evidence indicates that learners use the language during the task for constructing and interpreting meaning?

Authenticity	What evidence suggests that learners' performance in the CALL task corresponds to what one would expect to see outside the CALL task? What evidence suggests that learners see the connection between the CALL task and tasks outside the classroom?
Impact	What evidence suggests that learners learn more about the target language and about strategies for language learning through the use of the task? What evidence suggests that instructors engage in sound second language pedagogical practices by using the task? What evidence suggests that learners and teachers had a positive experience with technology through the use of the task?
Practicality	What evidence suggests that hardware, software, and personnel resources prove to be sufficient to allow the CALL task to succeed?

How educators can integrate behaviorist techniques in class room teaching learning process?

Educators can integrate behaviorist techniques in the classroom by using strategies that focus on observable behavior, repetition, practice, reinforcement, and clear stimulus–response patterns. Here are the key ways:

How educators can integrate behaviorist techniques:

1) **Use Positive Reinforcement**

   - Praise, stickers, points, rewards, or extra privileges when students show desired behavior.

2) **Use Negative Reinforcement (not punishment)**

   - Removing an unpleasant task when students behave correctly.

3) **Drill and Practice Activities**

   - Repetition of tasks such as vocabulary drills, grammar exercises, math problems, or pronunciation drills.

4) **Clear, Structured Instructions**

- ❖ Teachers give step-by-step directions and expect students to follow them exactly.

5) Immediate Feedback

- ❖ Correcting mistakes instantly so students form the right habits.

6) Shaping Behavior

- ❖ Breaking learning tasks into small steps and reinforcing each step of progress.

7) Use of Reinforcement Schedules

- ❖ Rewards given consistently at first, then gradually reduced as desired behavior becomes a habit.

8) Classroom Management through Rules and Consequences

- ❖ Setting clear rules and giving consistent consequences to reinforce discipline and good behavior.

Level of linguistic difficulties?

Level of linguistic difficulty means how easy or hard the language in a CALL task is for learners to understand and use. It checks whether the grammar and vocabulary in a CALL activity match the learner's ability level. If students use help options like word definitions it shows they are challenged but still learning. If they never use help the task may be too easy or if they cannot do it at all it may be too hard. So, observing how learners interact with the software helps decide if the language difficulty is appropriate.

Constructivism of model?

Constructivism says that learners build new ideas using their own experiences and knowledge. The learner plays an active role, makes decisions, and uses mental models (schemata) to understand new information. It focuses on understanding, thinking, and personal meaning rather than memorizing behaviors. A constructivist classroom is usually full of discussion, hands-on tasks, collaboration, and chances to try things out. The model keeps reminding us that learning grows out of doing, not just listening, and every learner constructs their own unique version of understanding.

Example:

Discovery of Grammar Rule:

Students interact with sentences in a CALL program and notice how a grammar rule works. They test different sentence forms and see which ones are accepted. Through exploration, they construct the rule themselves instead of being told directly.

The Role of Collaboration and Negotiation of Meaning in the Two Models?

Although the **constructivist model** clearly supports collaboration and negotiation of meaning, these features can also appear in the **behaviorist model**. Susman (1998) reviewed 36 CALL studies from 1980 to 1998. Out of these, 16 were tutorial and 10 were drill-and-practice (both behaviorist), and 10 were problem-solving (constructivist). But all 36 studies were considered cooperative, meaning students worked together in some way. Susman also used the terms cooperative and collaborative as if they were the same, even though cooperative tasks can be divided among students, while collaborative tasks require students to work together on every part.

The main point is that collaboration/cooperation and negotiation of meaning can happen in both behaviorist and constructivist CALL models, not only in one.

Five characteristics of language learning acquisition?

1) It is a **subconscious** process.
2) It happens through **natural communication**.
3) The focus is on **meaning**, not grammatical rules.
4) It leads to **spontaneous and automatic** language use.
5) It develops **fluency**.
6) It is Similar to first language acquisition

Write about Cyber bulling?

Even though the news often talks about cyberbullying, especially when a victim commits suicide, research does not focus much on how common it is or how it affects students. **Cyberbullying** means any kind of online harassment, like threatening emails or rude posts on social media pages.
Li (2006) studied 264 junior high school students and found that **half had been bullied**, and **about one-fourth had been cyberbullied**. Many students do not know their rights or that they should report cyberbullying. Even when they do know, many still feel scared or unwilling to report it. That is why teachers must understand cyberbullying and make sure students feel safe and confident to report any online abuse.

What is meant by C-M-C?

C-M-C (Computer-Mediated Communication) is when people use computers to communicate. It doesn't always involve learning but it creates chances to practice language especially when second-language learners talk with native speakers or peers in the target language.

Timex-Sinclair?

The Timex-Sinclair was an early home computer with a small memory (16K) but enough to store a lot of text. It was used during the early days of CALL. For perspective, this is equivalent to 417 million single spaced pages of text, or about 75 per cent of the capacity of a human brain. It was used in language learning research along with bigger computers in the 1970s and 1980s. It helped teachers and students use computers for learning languages.

Write a Note on Available Literature on CALL?

There is a lot of research on CALL, with thousands of articles, and almost 500 were used to prepare this series. We have many new and creative ideas, but we still do not have clear answers about the best way to use computers for language learning. Even though things are not fully certain, computers are now a normal part of daily life and education, so the question is no longer "Should we use computers?" but "How should we use them?" Researchers, developers, and teachers working in CALL must help the language-learning field understand and use this area better. Beatty (2003) describes CALL in a simple way: any situation where a learner uses a computer and improves their language as a result.

Empirical research of CALL?

Empirical research in CALL refers to **research based on actual data**, not opinions or theory. It involves observing how learners use computers for language learning and collecting evidence through experiments, classroom studies, surveys, interviews, or test results. The purpose is to find out **what really works** in CALL, such as whether certain software improves vocabulary, whether online communication helps speaking skills, or how students respond to digital tools. Empirical studies help researchers identify the strengths, weaknesses, and real impact of CALL on language learning. They provide proof-based answers to guide teachers, developers, and educators in using computers more effectively in the classroom.

Key Points of Empirical Research in CALL:

1) Focus on Evidence, Not Assumptions
2) Shift from Learning Outcomes to Learning Processes
3) Outcome Research Still Valuable
4) Each CALL Quality Requires Its Own Empirical Method

Note on Aims of Call?

The main aim of CALL is to use computers and technology to support language teaching and learning. It focuses on finding the best ways to use digital tools to help students learn a language. CALL includes many types of computer-based activities such as:

- Word processing and presentation software

- Drill and practice programs
- Tutorials and simulations
- Problem-solving tasks and games
- Multimedia CD-ROMs
- Internet tools like email, chat, and websites

CALL is also known by another name, such as:

- Computer-Aided Language Learning (CALL)
- Computer-Assisted Language Instruction (CALI)
- Computer-Enhanced Language Learning (CELL)

All these terms refer to using technology to improve language learning.

Explain context variables proposed by Dunkin and Biddle's?

Dunkin and Biddle's context variables include **pupil formative experiences and pupil properties**, which in a CALL environment are influenced by students' prior exposure to computers. Many learners may already have experience with computers or CALL before school shaping their skills and learning strategies. This experience helps them learn better with CALL and makes them see computer-based learning differently from regular classroom lessons.

characteristic of optimal input?

Krashen (cited in Kenning and Kenning, 1990) describes optimal input for acquisition as having four characteristics:

1) It is comprehensible
2) It is interesting and/or relevant to the acquirer
3) It is not grammatically sequenced
4) It is provided in sufficient quantity

Write about the storyboard activity Jones and Fortescue (1987) in CALL Classroom?

The storyboard activity is a computer-based guessing game. Students sit together in front of a computer. The screen shows only the title "Superstition" and many blank spaces instead of text. Students must guess the hidden words and type them in. They discuss with each other to decide which words to try. They talk, plan, and work together to rebuild the text. They can use any language to discuss, and they can take as much time as they need. The activity encourages teamwork and communication. During the task, the students' talk shifts between the meaning of the text, strategies for guessing words, and the actual language forms in the text. The activity gives some chances to focus on grammar and vocabulary, but how much students actually do that depends on their strategy and interest.

What do you about Chat Lines?

A chat line is also called **Internet Relay Chat (IRC)**. On the screen, there are usually **two sections**: one shows what the learner is typing, and the other shows the **main discussion** with other participants. When the learner finishes a message and clicks **send**, the message is added to the main discussion as fast as the computer and internet allow. In older programs, users might have to click **reload** or **refresh** to see the newest messages.

Graffiti Handwriting Software?

Graffiti was a system for recognizing handwriting on PDAs before keyboards were common. Users had to write each letter separately with simplified forms. It was easy to learn using practice games, but mini-keyboards later became more popular and replaced Graffiti. Graffiti used modified and simplified punctuation, numbers and upper-case letters. Each character had to be unconnected; one could not write on the screen without lifting the stylus between letters. However, each character is a continuous line. The system was quickly and easily learned with games that helped develop fluency. However, its popularity waned in the face of easier to use mini-keyboards which have now become the norm.

What are the Reasons of computer usage in language learning process?

The need to teach languages effectively and scientifically, especially for military purposes, led to time and money being invested in language research. At the same time, research on things like **machine translation** was also happening, which later influenced CALL.

Many of these projects were funded partly because of **Cold War politics**. For example, after the USSR launched **Sputnik** in 1957, the US wanted to improve its science and language skills. The first CALL programs were created at **Stanford University, Dartmouth College, and the University of Essex** (The Scientific Language Project). They mainly focused on teaching **Russian**, but later included other languages too.

Five ways of Establishing environment where CALL may take place?

The five environments where we can create a CALL (Computer-Assisted Language Learning) setting are **MOO, MUA, MUD, MUSH, MUG** these are online multi-user spaces where participants interact in real time using characters or objects. They were originally designed for socializing and gaming but now can be used for collaborative language learning. MOO objects may be photo-realistic 3-D manipulated models or 2-D flat representations. This environment is a synchronous online multi-user space, that is, action takes place in real time. MUDs were originally developed in 1978 by Roy Trubshaw, a student at Essex University.

What is learner fit?

Learner fit means choosing CALL tasks that match the learner's language level and personal characteristics. The task should include language that is new but still reachable for the learner; too easy or too difficult language will not help progress. Factors like age, confidence, willingness to communicate, and learning style also affect whether the task is suitable.

Mastery learning (P. Lai and J. Biggs)?

Mastery learning is based on the idea that all students can learn well if they are given enough time. Learning content is divided into small units, and each unit has a formative test. If a learner fails, they are given more time and extra help until they reach the required level or "mastery."

Write the three-problem developing new call?

1) a lack of fund
2) Lack of expertise
3) Lack of suitable authoring programs

What is Email? OR How Email is used as an effective CALL approach?

Email (short for **electronic mail**) is a way of sending and receiving messages using the **internet**. It allows users to write messages on a computer or device and send them instantly to someone else's email address anywhere in the world. Emails can include **text, files, images, and links**, and they are faster and more convenient than traditional postal mail. Learners can ask for information, share assignments, or submit work. Teachers often suggest composing messages in word-processing software first to reduce errors.

3 aspects of lack of expertise?

Three main aspects of the lack of expertise in CALL (Computer-Assisted Language Learning) are:

1) **Limited Skills in All Areas:** People who make CALL software usually know either programming, design, or teaching methods but not all three. So, one part of the program may be good while other parts have problems.
2) **Need for Many Professionals**: Making high-quality software needs many experts like writers, editors, designers, sound creators, and animators. A single teacher or small team cannot match the work of professional companies.
3) **Difficulty in Collaboration**: Schools can try to form expert teams, but it's often hard to organize and manage. Working with commercial publishers can help, but there's a risk that the software might lose its local focus or purpose.

Individual characteristics of CALL?

- Learning style

- Language proficiency
- Motivation
- Learner control:
- Age

Note on Corpus Linguistics?

The corpus in corpus linguistics refers to a **body of text**. Corpus linguistics studies large collections of written or spoken texts called corpora (corpora - plural of corpus) to see how language is used. These collections can be small or huge like the British National Corpus with 100 million words. Computers help count word frequency, analyze grammar, and find patterns in language.

Both teachers and learners can use corpus linguistics in various ways within the classroom:

A teacher can collect student assignments and use a concordancing program to find common mistakes in their writing. These mistakes can then help create learning materials. Alternatively, a teacher can look at texts written by native speakers in a corpus and find patterns to show students or turn into exercises.

Students can also learn to use concordancing programs and corpora themselves. They can become researchers, finding examples and making their own rules for grammar, idioms, and word use, such as the difference between **"look"** and **"see."** This method is called **Data Driven Learning (DDL)**.

Comparison of CALL and NON-CALL activities?

CALL activities are language learning tasks done with the help of computers while NON-CALL activities are done without computers.

In CALL research, results were mixed. Piper (1986) found that when students used computers their talk was often messy and disorganized with everyone speaking at the same time. He said their language focused only on the present moment and used mostly simple present tense.

But another researcher, Mohan, found that CALL activities were more meaningful. Students discussed ideas, made choices and solved problems together. This helped them use language in smarter ways which can improve their learning and communication in real-life situations.

5 concerns for development of CALL?

1) Concerns for software development
2) Pedagogical concerns for classroom practice
3) Evaluating software
4) Learning and working styles

5) Evolving technology

Five concerns for call software development?

1) Technical Reliability
2) Flexibility and Adaptability
3) User-Friendliness
4) Feedback quality
5) Engagement and Motivation
6) Accuracy of Content

Commercial Quiz Software?

Many online learning games are in the form of quizzes. These quizzes are motivating because they let learners check their progress without the pressure of formal exams. Computer-based quizzes like cloze exercises let learners fill in missing words and often provide hints which encourages careful reading. However, they can be frustrating if the program doesn't accept synonyms and requiring the exact word.

A popular quiz format is a cloze exercise, such as one of several test types found in Respondus (http://www.respondus.com), a popular assessment tool used with computer-based course design packages such as Blackboard Vista. Other quiz software includes programs to check spelling, listening, speed reading, knowledge of synonyms and antonyms, general knowledge and other English skills.

3 rationale of drill ND practice?

- Repeating the same material helps learners strengthen and improve their learning.
- Computers can give unlimited practice with immediate non-judgmental feedback.
- Computers let students work at their own pace and save class time for other tasks.

What is WWW?

The World Wide Web (WWW) is a global network of websites that provides many opportunities for learning languages online through different educational and commercial platforms. Through the WWW, users can view **webpages, images, fvideos, and other information** from anywhere in the world by clicking on links. The World Wide Web is an online space where information is connected and can be easily accessed through websites.

What do you know about Plagiarism?

Plagiarism means using someone else's work without giving them credit. All computer-based materials like text, pictures, music, or software are made of digital data (1s and 0s). Because of this it is very easy to copy and change them. Many students take text or images from websites

and use them in their projects. Some countries allow limited use of such materials for classroom learning but this does not mean students can post copied content online. Copying text or images from the internet without credit is plagiarism. Tools like plagiarism.org help teachers check if students have used others' work without permission.

Examples:

- Copy–Paste from Internet
- Paraphrasing Without Acknowledgment
- Using a Friend's Assignment
- Not Quoting Directly

Note on viruses?

Viruses are harmful computer programs that spread through the internet and email. They can slow down your computer damage files or even delete important data. New viruses are created every day making it hard and costly to keep antivirus software updated. A virus usually needs the user to open or run a file for it to start working. In the past viruses often came with files ending in .exe but now they can also hide in files like .doc or .jpg. Many viruses spread through unwanted emails or illegal software. Once a virus gets into a computer, it can send copies of itself to all contacts in the user's email list, spreading even further.

Write the five advantages of Hypertext?

1) Presents material at the appropriate level
2) Many appropriate readings of a document
3) Links to references, definitions, etc.
4) Interactive pictures
5) Reader response
6) Tracking of readers

Briefly Explain Computer-Adaptive Testing (CAT)?

CAT is a type of test taken on a computer where each question changes according to the learner's performance. If a student answers correctly, the next question becomes harder; if the answer is wrong, the next one becomes easier. This helps match the test difficulty to each learner. It also gives different versions of the test to students in the same room. However, CAT takes a lot of time to create, and students cannot go back to change previous answers.

Explain HyperCard?

In 1984, Apple introduced the Macintosh computer which was different from earlier computers because it used a graphical user interface (GUI). Instead of typing long commands users could click on icons something we now see in all modern computers and smartphones. One of the most

important innovations on the Macintosh was a program called HyperCard. It allowed users to create virtual "index cards" that could include text, images, audio, video, and interactive buttons. These cards could be linked to each other, creating a hypermedia system. HyperCard was important for CALL because it let teachers and students design their own interactive language learning materials easily. It was one of the first programs to use the idea of hypertext and multimedia for education.

Example:

Reading Comprehension Stack

A story was placed on several connected cards. Students clicked on words to get definitions, notes, or audio help. Links guided learners through questions, hints, and feedback, creating an interactive reading experience.

Questions for Judgmental Analysis of CALL Appropriateness?

Qualities	Questions
Language learning potential	Do task conditions present sufficient opportunity for beneficial focus on form?
Learner fit	Is the difficulty level of the targeted linguistic forms appropriate for the learners to increase their language ability? Is the task appropriate for learners with the characteristics of the intended learners?
Meaning focus	Is learners' attention directed primarily toward the meaning of the language?
Authenticity	Is there a strong correspondence between the CALL task and second language tasks of interest to learners outside the classroom?
Impact	Will learners be able to see the connection between the CALL task and tasks outside the classroom? Impact Will learners learn more about the target language and about strategies for language learning through the use of the task? Will instructors observe sound second language pedagogical practices by using the task?
Practicality	Will both learners and teachers have a positive learning

	experience with technology through the use of the task? Are hardware, software, and personnel resources sufficient to allow the CALL task to succeed?

Explain John Underwood Series?

John Underwood, who in 1984 proposed a series of **"Premises for 'Communicative' CALL"** (Underwood, 1984, p. 52). According to Underwood, communicative call:

1) focuses more on using forms rather than on the forms themselves
2) teaches grammar implicitly rather than explicitly
3) allows and encourages students to generate original utterances rather than just manipulate prefabricated language
4) does not judge and evaluate everything the students nor reward them with congratulatory messages, lights, or bells
5) avoids telling students they are wrong and is flexible to a variety of student responses
6) uses the target language exclusively and creates an environment in which using the target language feels natural, both on and off the screen
7) will never try to do anything that a book can do just as well

Collaboration in CALL?

Collaboration in CALL refers to learners working together through computer-based tools to complete tasks, share ideas, and negotiate meaning. Collaboration helps develop social and thinking skills and reflects real-world learning situations. In language learning working together lets learners discuss meanings, make decisions about study materials and improve understanding through interaction. Tools like chat, forums, shared documents, and online tasks support collaborative learning.

Three ways of evaluating CALL?

1) **Language learning:** How well the task creates chances for learners to notice and practice useful language forms.
2) **Learner fit:** How well the task matches learners' needs, level, and characteristics so they can engage effectively.
3) **Meaning focus**: How strongly the task directs learners to understand and use meaningful language rather than just isolated forms.

Note on À la rencontre de Phillippe?

Two projects to come out of ALLP merit special mention, No Recuerdos (I Don't Remember) and À la rencontre de Phillippe (Recognizing Phillippe).

Like No Recuerdos, the program À la rencontre de Phillippe lets learners experience a semi-real language environment. The story is fictional but shows real-life situations in Paris. Phillippe has lost his apartment and needs to find a new one, creating a sense of urgency. Learners help Phillippe find an apartment, which can be done in different ways or ignored if they just explore the program. To find an apartment, learners use on-screen phones and fax machines and look for written clues like notes on walls and poles. Another feature lets learners make their own documentaries about the same neighborhood.

Explain No Recuerdos?

No Recuerdos (I Don't Remember) has a strong story where Gonzalo, a scientist with amnesia, can't remember the location of a biological hazard that could destroy Latin America. The urgent need to help Gonzalo creates a fast pace for the learner.

To complete tasks, learners gather information by questioning Gonzalo (the program). Part of the program's artificial intelligence comes from Weizenbaum's Eliza (1976), which simulates a listening partner by asking questions, giving comments, and rephrasing the learner's answers.

Measurements of language learning in CALL?

1) CALL can track how much of a program a student explores and how much time they spend on each part.
2) Students can get immediate feedback on their progress, helping them see their own improvement.
3) CALL provides continuous assessment, unlike traditional classrooms where teachers check understanding occasionally or only at the end.

CALL – Language Learner?

CALL – Language Learner CALL allows learners to control their own learning process and progress. Using effective and suitable software applications, CALL can provide communicative meaningful language learning environments. Good quality and well-designed CALL software can offer a balance of controlled practice and free communicative expression to the learners, including immediate feedback. In the future, with the advance of computer technologies, it is expected that CALL will be able to absorb some teaching functions. However, despite greater user-friendliness, and effectiveness, CALL will never replace the teacher. Like other new technologies, CALL is not a magic solution to language teaching. The effectiveness of CALL relies on how CALL is utilized to meet language learning goals for individualized learners in specific educational settings.

Microcomputer?

A microcomputer is an early type of small personal computer used in the 1980s such as the BBC computer, Apple II, and IBM PC. During this period:

- Teachers and programmers start creating language learning activities on these small computers.
- Many teachers learned simple programming (like BASIC) to make exercises for their own students.
- These early users formed groups at conferences and later helped create major CALL organizations such as CALICO, TESOL's CALL section, and Euro CALL.

In short microcomputers were the first personal computers that helped teachers develop early CALL materials.

how to protect from plagiarism?

The internet makes it very easy to copy others' work, but it also gives ways to check and stop plagiarism. Teachers can simply copy a few lines of a student's text and paste them into a search engine like Google to see if the same words appear on a website. This helps find if the work was copied. Websites like Turnitin make this process easier. When a student uploads their work, Turnitin checks it against millions of online sources and other students' papers. It then shows if any part is copied. Some teachers ask students to check their own work on Turnitin before submitting it so they can correct any copied parts and avoid plagiarism.

Main Issues in Copyright and plagiarism??

Copyright Issues:

- Using someone else's work (books, music, software, images) without permission.
- Sharing or copying work illegally.
- Not giving proper credit to the creator.

Plagiarism Issues:

- Presenting someone else's words, ideas, or work as your own.
- Copying text from books, articles, or the internet without citation.
- Paraphrasing without acknowledging the source.

Write a note on hypermedia?

Hypermedia, an extension of the term hypertext, is a nonlinear medium of information that combines text, images, audio, video, and links allowing users to explore information in different

ways instead of following a fixed order. The World Wide Web is a common example of hyper media. Early examples include the Aspen Movie Map, and programs like HyperCard helped popularize it. Today hypermedia can be delivered through web browsers, media players, or standalone software, and audio-based hypermedia is emerging with voice-controlled devices. **The WWW (World Wide Web)** is a classic example of hypermedia, whereas a non-interactive cinema presentation is an example of standard multimedia due to the absence of hyperlinks. Most modern hypermedia is delivered via electronic pages from a variety of systems including media players, web browsers, and stand- alone applications (i.e., software that does not require network access). Audio hypermedia is emerging with voice command devices and voice browsing.

Define SLA?

Second Language Acquisition (SLA) means the process of learning a new language after a person has already learned their first language as a child. It includes both the study of how individuals or groups learn another language and the actual process of learning it.

Example: A child whose first language is **Urdu** learns **English** at school. Over time, they become able to speak, read, and write in English.

How Virtual Classroom works?

A virtual classroom is an online classroom that allows participants to communicate with one another, view presentations or videos, interact with other participants, and engage with resources in work groups. Wesley and Franks (1994) describe a **virtual classroom** as an online classroom that can grow in time, space, and content. It can keep expanding as new knowledge and members are added. Learning isn't limited to school semesters or years—past learners can stay and keep learning or help new learners.

Anyone in a virtual classroom can connect with anyone else, sharing information and solving problems together. Over time, virtual classrooms have included things like animated avatars in Second Life or online teaching platforms like Blackboard with live chat. Most of these are forms of **distance learning** using email, the internet, or computer-based tools, similar to many CALL programs.

Describe "authenticity criterion" in CALL evaluation process?

It means CALL tasks should be similar to real-life language use so learners can practice meaningful, practical communication. The authenticity criterion checks whether a CALL activity gives learners the chance to use language for real communication, just like they would in everyday life. Authentic tasks make learning more meaningful and interesting, because learners can see the connection between classroom practice and real-life use. When learners find tasks relevant and realistic, they become more motivated and willing to communicate.

Explain PLATO?

PLATO stands for Programmed Logic for Automated Teaching Operations. It was developed in 1959 by the University of Illinois along with Control Data Corporation. PLATO was one of the first and most important computer systems used for teaching languages. What made PLATO special was that its computer and programming language were made especially for education. It combined the best features of early CALL systems from other universities. Unlike other systems PLATO was used for many subjects not just language learning. One of its main uses was for teaching Russian grammar as a second language. PLATO became a model for future CALL systems in education.

By early 1976, the original PLATO IV system had 950 terminals giving access to more than 3500 contact hours of courseware, and additional systems were in operation at CDC and Florida State University. Eventually, over 12,000 contact hours of courseware was developed, much of it developed by university faculty for higher education.

What are Personal Digital Assistants (PDAs)?

A Personal Digital Assistant (PDA) is a small hand-held computer for downloading and storing information such as documents, databases and calendar entries. It is less powerful than a desktop or laptop computer, but less expensive and more portable. Portability is achieved by eliminating the keyboard and minimizing the screen size. PDAs have largely been replaced in the marketplace with mobile telephones that share many of the same functions and often feature Internet connectivity.

Note on Focus on Form?

Focus on Form means drawing learners' attention to specific grammar or language structures while they are mainly focused on meaning. It helps learners notice important grammar points that appear naturally in communication. Instead of learning rules separately, students learn how forms are used in real sentences or tasks, often through highlighting or short explanations.

Research on CALL activities that **focus learners on specific language forms** is limited, but one study shows it helps. Doughty (1991) tested learners reading passages with **relative clauses**. Some learners had the clauses **highlighted** and were given either grammar rules or sentence explanations, while others had no highlighting. The groups with highlighted input did better on grammar tests, and the group with explanations also did better in **reading comprehension**. This shows that CALL materials that highlight important language forms can help learners learn more effectively than materials that don't.

How CALL effects on learning?

1) Focus on Language Forms
2) Immediate Feedback

3) Flexible Learning
4) Interactive Practice

What are Net Pals?

One informal use of email is for the establishment of email pen pals. Such pen pals or pen friends are sometimes called net pals. Net pals are email pen friends usually pairing a language learner with a native speaker of the target language. They offer authentic examples of language use. The success of net pals depends on shared interests and motivation. Challenges include misunderstandings from slang, idioms, or typos. Teachers can support learners to make the interaction more effective.

Collaboration between learners and teachers?

Collaboration happens when teachers and students work together to achieve learning goals. Teachers guide, support, and provide feedback, while learners **actively participate, ask questions, share ideas, and solve problems**. This teamwork improves understanding, motivation, and problem-solving skills.

Collaboration of CALL with SLA?

CALL (Computer-Assisted Language Learning) supports **SLA (Second Language Acquisition)** by providing interactive tools, focused input, and practice opportunities. It helps learners notice language forms, get immediate feedback, and engage in meaningful communication, which are all important for acquiring a second language.

CALL Emergence?

CALL became a separate field in the early 1980s with conferences and organizations, thanks to the rise of personal computers. Before that, in the 1950s and 60s, some early attempts to teach languages using mainframe computers were made. The first large project was the **PLATO system** at the University of Illinois. It gave students language practice based on their level, with feedback and help when needed. PLATO included materials for several languages, especially French, and kept detailed records useful for teachers, students, and researchers.

What are Simulations?

Simulations are instructional scenarios where the learner is placed in a "world" defined by the teacher. They represent a reality within which students interact. The teacher controls the parameters of this "world" and uses it to achieve the desired instructional results. Students experience the reality of the scenario and gather meaning from it. A simulation is a form of experiential learning. It is a strategy that fits well with the principles of Student-Centered and constructivist learning and teaching. Simulations are characterized by their non-linear nature and

by then controlled ambiguity within which students must make decisions. Simulations take a number of forms. They may contain elements of:

- a game
- a role-play
- an activity that acts as a metaphor

Teacher and pupil classroom behavior?

In a CALL classroom computers give students more independence because they can learn anytime and anywhere with a computer. While CALL tools can't fully replace a teacher, they usually offer more resources than a textbook. Tasks in CALL can focus on different language areas like grammar, vocabulary, or skills like reading, writing, listening, and speaking. Teacher help students use the software effectively, give support when needed, and design tasks that match students' levels and learning goals.

negotiation of meaning in the communication process?

Negotiation of meaning in the communication process happens when learners work together to understand each other's ideas clearly. In computer-based activities students often gather around a computer to solve problems, discuss tasks and share discoveries. This interaction helps them use language actively to explain question and clarify meaning. According to Stevens (1992), negotiation of meaning can occur in three types of communication: between learners and peers, learners and teachers, and learners and computers. All these forms of interaction help learners improve their language skills because they involve discussion, correction, and understanding through guided support (also called scaffolded instruction).

Five Technology Tools for Reading Skills?

1) E-books
2) Audiobooks
3) reading apps
4) text-to-speech tools

Criteria for CALL task appropriateness?

Language learning potential	The degree of opportunity present for beneficial focus on form.
Learner fit	The amount of opportunity for engagement with language under appropriate conditions given learner characteristics.
Meaning focus	The extent to which learners' attention is directed toward the meaning of the language

Authenticity	The degree of correspondence between the CALL activity and target language activities of interest to learners out of the classroom.
Positive impact	The positive effects of the CALL activity on those who participate in it.
Practicality	The adequacy of resources to support the use of the CALL activity.

Explain Locus of Control?

Locus of control means how much control the **learner** has versus how much control the **program** has during learning—such as choosing content, order, or activities.

Jonassen says the two ends of this control form a line:

- One end is **objectivist** (teacher/program controls everything).
- The other end is **constructivist** (learner controls more and builds their own understanding).

Chandler explains it differently:

- **Tutorials and some games** follow a **behaviorist** style where students work alone, follow instructions, and there is no collaboration.
- **Simulation games and experimental simulations** follow a **constructivist** style where students learn better by exploring, struggling, and making meaning themselves.

Remember me in your Prayers.

Best of Luck 🙃🙂
