

PSY101 Quiz 4

Start Time: 07:10 PM, 02 March 2022

Question # 1 of 10 (Start time: 07:10 PM, 02 March 2022)

Total Marks: 1

Measures of blood pressure indicated a tendency for higher blood pressure levels in residents of:

Select the correct option:

☐	Slums
☐	Proper household
☒	Single rooms
☐	Bangles

Submit

Question # 2 of 10 (Start time: 07:16 PM, 02 March 2022)

Total Marks: 1

The proportion of a region's population that lives in towns and cities and the rate at which this proportion is growing is known as what?

Select the correct option:

☒	Urbanization
☐	Be centralization
☐	Industrialization
☐	Globalization

Submit

PSY1011 Quiz 4

Question # 3 of 10 (Start Time: 07:10:00 PM, 02 March 2022) Total Marks: 1

Pakistan's urban population will be equal to its rural population by:

Select the correct option

- ☒ 2030
- ☐ 2050
- ☐ 2040
- ☐ 2060

PSY1011 Quiz 4

Question # 4 of 10 (Start Time: 07:10:00 PM, 02 March 2022) Total Marks: 1

Which of the following is free from the impacts of population growth?

Select the correct option

- ☐ Public Policy and the Environment
- ☒ Resource Depletion and Environmental Deterioration
- ☐ Increase in Urban Population
- ☐ Decrease in IQ level of Urban Population

PSY111 Quiz 4 Quiz Start Time: 07:04 PM, 02 March 2022

Question # 7 of 10 (Start time: 07:05:11 PM, 02 March 2022) Total Marks: 1

Which of the following is NOT an effect of urbanization?

Select the correct option:

- ☒ City does not provide you all infrastructure ✓
- ☐ Urbanites are more cooperative than individuals residing in rural areas
- ☐ Crowding in everyday settings
- ☐ City provides you all infrastructure

Which one of the following measures is expected to have the least impact on climate change?

Select the correct option

☐ Switching to LED light bulbs

☐ Subsidizing renewable energy

☐ Enhancing energy efficiency

☐ Green transportation

Correct Answer: Subsidizing renewable energy

LESSON 31

POPULATION AND ENVIRONMENT

Current trends in world population point out that by 2050 the world population is likely to be 10 billion and by the end 21st century the numbers may rise to 10 billion. Populations in Sub-Saharan Africa and in The Himalayan regions of Asia have already exceeded the immediate capacity of the area to sustain life.

The impacts of population growth may be understood in the following areas.

1. **Resource Depletion and Environmental Deterioration**

Resource Depletion is evident in highly productive irrigated farmland, Reforestation is essential in tropical forest, depletion of natural resources (USA). This includes extensive loss of tropical forest, permanent soil degradation (Amazon River Basin) regional water shortages and deteriorating water quality.

Increases of 200-300 percent in the world water withdrawals in the next twenty years is predicted. Of 280 major river basins of the world, 140 are shared by two countries and 82 are shared by chemical waste being produced at rates faster than we can safely dispose them. Non-renewable resources are being consumed at increasing rates.

2. **Public Policy and the Environment**

Preserving the carrying capacity of earth, major policy changes coupled with government, business and individual actions are required to alleviate these problems. Important measures need to be taken such as: reducing deforestation, afforestation, diversification of chemical to produce better, improved soil management, energy and material conservation, industrial and household recycling.

Question # 2 of 10 (Mark: 100%) (PVT/17646-1)

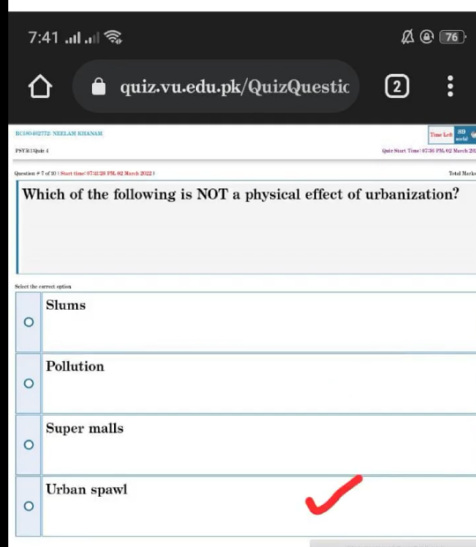

Current trends in world population point out that by the end of 21st century the number may touch which of the following?

- Select the correct option
- | | |
|-----------------------|------------|

|-----------------------|-------------------|
| ☐ | Be centralization |
| ☐ | Urbanization |
| ☐ | Globalization |
| ☐ | Industrialization |
-

[illegible]

Milgram proposed which of the following concept?

- Select the correct option
- ☐ Urban Planning
 - ☒ Urbanization
 - ☐ Urban Spawl
 - ☐ Ruralization

1966). Dohrenwend and Dohrenwend (1972) have reported that the incidence of psychoses is higher in rural areas than in cities. Thus, the city does not seem to be a consistently pathological environment when compared with rural areas.

Social-Behavioral Effects

Differences between urban and rural settings have been reported in the occurrence of affiliation, prosocial, and antisocial behavior. Studies have indicated that urbanites are less likely to help strangers than are people in rural areas (e.g., McCauley, 1976; Milgram, 1977; Newman & McCauley, 1977). Urbanites tend to avoid eye contact with strangers and are less likely to reciprocate friendly gestures than are rural-dwellers. While studying prosocial behavior, several researchers have reported that urbanites are less likely to help a stranger (Gelfand, Hartman, Walder, & Page, 1973; Korte & Kerr, 1975; Milgram, 1970, 1977). However, it does not follow that urbanites are inherently less friendly and helpful than people in rural areas. These differences could be explained simply in terms of the urbanites paying less attention to other people, perhaps as a means of coping with excessive stimulation (see Moser, 1988).

Finally, regarding antisocial behavior, clear differences have been reported between urban and rural areas in the incidence of crime (Carlson & Levy, 1971; Fischer, 1976; Zimbardo, 1969), with rural areas definitely being safer than cities. While this may seem obvious, the reasons for greater crime rates in cities are not wholly understood. Zimbardo (1969) proposed the concept of *diffused social responsibility* to explain the high crime rate in cities. The inhibitions against antisocial behavior, such as the fear of getting caught and being humiliated before the community, are less effective in a city than in a small town. Owing to

Question # 4 of 20 (Mark: 0.00) PSL 42 March 2022

Who proposed the density-intensity model to explain the contradictory responses of individuals to high density?

- Select the correct option.
- ☒ Freedman (1975)

☐	Bangladesh
☐	India

[View the correct answer & report this question](#)

These contradictory results could be due to differences in methodologies and in definitions of density and crowding, or they could simply mean that there is no consistent relationship between residential density and crowding. It is possible, however, that the differential results are mediated by social variables. An alternative study in this regard was conducted by Woot (1984). Data were obtained on household density, loneliness, and social isolation. Woot reported that both loneliness and density were associated with social isolation. He argued that density bears only a distal relationship to social isolation (i.e., it is not density level per se, but the quality and quantity of social interaction and the nature of separation between people that may be "pathological"). Woot concluded that household density may simply aggregate or accentuate pre-existing or incipient psychosocial problems. Also, Noll and Jones (1986) studied the impact of environmental stressors on psychological health in urban "boom" communities in Australia and reported that most of the variance could be explained by loneliness. Thus, it is possible that either high or low density produces adverse effects, a point to which we will return in Chapter 10 regarding territoriality and privacy.

Many people have questioned whether responses to density are **culture** specific. For example, there are clear differences in objective population density in the United States compared to China. Could it be that individuals in these countries differ in their responses to density? Smith, Kallman, and Hogue (1996) did report cross-cultural differences, with Asians being more tolerant of high density and British respondents being more adaptive with Southern European somewhere in between them two. Chaffin and Carling (1984) reported that the negative image and experience of "high-rise" housing prevalent in our **culture** did not emerge in responses of such residents in Israel.

These differences could be due to varying adaptation levels across **cultures**. Developed by living exposure to different population densities. However, we must be careful of overgeneralization. Chaffin and his colleagues (1996, 1998, 1999, 2001) have challenged the belief that the Chinese hold different attitudes toward crowding than the larger U.S. population. In surveys of residents of San Francisco's Chinatown area, these respondents reported a relationship between high population density, commercial development, and increased neighborhood satisfaction and between increased building density and lower feelings of safety. These respondents generally evaluated crowding as undesirable, and their results indicate that prolonged exposure to high density breeds dislike for crowding in a primary environment (i.e., the home) more than in a secondary environment (i.e., the neighborhood). Similarly, Hwang (1978) reported that the Japanese also view crowding as a negative experience.

← inside density 1 of 2 >

Defining Density
Investigations have utilized various measures of population concentration, and for the most part have been inconsistent in using the same meaning and ability to refer to these measures. When the distinction has been made, these measures are sometimes as to the appropriate measure of density. Schaefer (1977), for example, contrasted the relationship between five semi-independent measures of density and adult crime and juvenile delinquency.

They used the following five measures:
1. average household size
2. proportion of married couples without their own home
3. proportion of dwelling units in structures with four or more living units
4. population per acre
5. percentage of occupied dwellings with 1.51 or more persons per room—only the last two showed strong positive relationships with delinquency and adult crime.

In subsequent work Schaefer (1981) has distinguished between **inside density** and **total density**. That is, Schaefer would distinguish between the number of people per unit of living space and the number of people in the larger community (e.g., persons per acre). Others have made similar distinctions (see, for example, Galle, Cress, & McPherson, 1977; Jarvin, 1961; Zlotnick & Altman, 1972). The importance of these measures becomes apparent when the following possibilities are considered: low inside-low outside (suburban), high inside-high outside (urban ghettos, barrios, and others), low inside-high outside (lower inner city apartments and condominiums), high inside-low outside (rural farm areas). Using only **inside density** as a predictor one would have to presume the effects of density to be the same in the urban ghettos as in the rural farm areas, whereas using outside density would lead to predictions of luxury apartment dwellers and ghetto residents showing similar effects. These predictions are, of course, not and undermine the need for careful delineation of the term density.

A second difficulty that the preceding possibilities illustrate is the difference in socioeconomic, ethnic, and social structure variables that are likely to exist among the four areas. It is possible that these variables may be related to delinquency or pathological activity independent of population concentration, but using as their primary measure, concentration with density, the cause gets muddled. More recent studies have shown that some confounding may appear in the density measures being utilized and that can result for the possible confounds of social structure variables, for example, in a study by Galle, Cress, and McPherson (1977) persons per acre was shown to be positively related to public assistance use, juvenile delinquency, and the use of admission to mental hospitals. However, when the authors controlled for social class and ethnicity these relationships disappeared. Thus, density appeared to be unrelated to social disadvantage when social class and ethnic variables were considered. Galle's group, not content with such a simple conclusion, modified their data. In the subsequent analysis, density was defined differentially as:

rural to rural migration. The same pattern has been observed for females is 51 percent in Pakistan. A relatively large fraction of rural migrants are female. The perception that "the urban migrant is invariably a male" is a proportion of migrants.

3. Slum Population

At least one in every three city dwellers in Pakistan **lives** in a slum. To find jobs and have a better life, may not find jobs in the formal sector, minimum of basic amenities. The informal sector provides employment. Squatter colonies where they build some kind of shelter for themselves. These settlements have spread in most urban localities, particularly in urban areas.

differences in either judged pleasantness or arousal level. There is a tendency for higher blood pressure levels in residents of single

differences in methodologies and in definitions of density and there is no consistent relationship between residential density and health. Residential results are mediated by social variables. An illustrative example is loneliness (1984). Data were obtained on household density, loneliness, and loneliness and density were associated with **suicide** ideation. The relationship to **suicide** ideation (i.e., it is not density level per se, but the nature of separation between people that may be affected by density may simply aggravate or accelerate not cause or prevent it. Neil and Jones (1988) studied the impact of environmental "isolation" communities in Australia and reported that most of the time, it is possible that either high or low density produces the effect. See Chapter 10 regarding territoriality and privacy.

LESSON 37

103

differences could be due to varying adaptation levels across cultures developed by different population densities. However, we must be careful of overgeneralization. Crites (1960, 1986; Loo & Ong, 1984) have challenged the belief that the Chinese (toward crowding) than the larger U.S. population. In surveys of residents of their own area, these researchers reported a relationship between high population density and lowered neighborhood satisfaction and between increased building density and decreased sense of safety. Their respondents generally evaluated crowding as undesirable, and they reported that prolonged exposure to high density breeds dislike for crowding in a primary environment more than in a secondary environment (i.e., the neighborhood). Similarly, Homma (1986) and Japanese also view crowding as a negative experience.
