

# PSY502 - Lesson 34+35

## Neo-Freudians

1. Harry Stack Sullivan
2. Karen Horney
3. Erich Fromm

## HARRY STACK SULLIVAN

Who was he?

Sullivan was a psychiatrist (a medical doctor who treats mental illness). He believed that **personality develops from relationships**, especially early ones with caregivers.

Big idea of Sullivan:

Your personality (your psyche – meaning your inner mental world: thoughts, feelings, self image) is shaped by how people treat you, starting with your mother.

He said a baby feels **euphoria** (strong pleasure and comfort) when the mother feeds and protects him. If the mother is calm, the baby feels safe. If the mother is tense, anxious, or rejecting, the baby feels insecure.

So anxiety (uneasiness, fear, emotional tension) starts early and comes from relationships.

---

### SULLIVAN'S THREE PARTS OF SELF

---

Sullivan said the "self" develops in three parts:

1. Good-me

Meaning: The parts of you that you like and feel proud of.

These parts do not create anxiety.

Example:

You think, "I am kind. I am helpful. I am smart."

You show this side to others easily.

1. Bad-me

Meaning: The parts of you that make you feel guilty, ashamed, or embarrassed.

These create anxiety.

Example:

You remember a time you lied, hurt someone, failed an exam, or acted rudely.

You do not like thinking about this version of yourself.

1. Not-me

Meaning: The parts of you that are **so scary** that your mind pushes them out of awareness.

This is similar to Freud's idea of repression (pushing things into the unconscious).

Example:

A person who was abused might block out certain memories or feelings because thinking about them creates too much anxiety.

So:

- Good-me = safe and accepted
- Bad-me = shameful
- Not-me = terrifying, buried in the unconscious

---

## THREE TYPES OF EXPERIENCE (MODES OF THINKING)

---

Sullivan said we experience the world in three ways:

1. Prototaxic experience

Meaning: The raw, unorganized experience of a baby.

Example:

A newborn feels hunger, warmth, pain, comfort.

But the baby does not think logically yet. It is just sensation.

1. Parataxic experience

Meaning: The child feels things but does not understand logical connections.

Example:

A child thinks, "Every time I wear this shirt, something bad happens."

There is no real cause, but the child connects things emotionally, not logically.

This is magical thinking.

1. Syntactic experience

Meaning: Logical, socially shared thinking.

This is adult thinking.

Example:

You understand cause and effect.

You use language that others also understand.

You think in ways your culture agrees with.

So:

- Prototaxic = baby feelings
- Parataxic = emotional, illogical connections
- Syntactic = logical, adult, social thinking

---

## SULLIVAN'S STAGES OF DEVELOPMENT

---

1. Infancy (birth to about 1 year)

Focus: Comfort, safety, mother–infant bond.

2. Childhood (up to about 8 years)

Focus: Learning language, communication, supervision.

### 3. Juvenile era

Focus: Playmates and social skills.

### 4. Pre-adolescence (8 to 12 years)

Focus: Close friendship with one peer.

This teaches intimacy and self worth.

### 5. Early adolescence (13 to 18 years)

Focus: Puberty, attraction, sexual identity, peer approval.

### 6. Adolescence

Focus: Long term relationships, identity, independence.

### 7. Maturity

Focus: Career, family, responsibility.

If early relationships go wrong, anxiety increases and adult relationships suffer.

---

## SULLIVAN'S THERAPY

---

He worked mainly with schizophrenia (a severe mental disorder involving confusion, hallucinations, and withdrawal).

He used:

- Interview (talking deeply with the patient)
- Empathy (feeling with the person, understanding their emotional world)

## KAREN HORNEY

Who was she?

A psychoanalyst who disagreed with Freud.

She said sexuality is not the main driver of behavior.

The main problem is **basic anxiety**.

Basic anxiety = a deep feeling of helplessness and fear caused by bad parenting.

If parents are cold, rejecting, or inconsistent, the child feels:

- Unsafe
- Unloved
- Alone

This creates **neurosis** (a long term pattern of anxiety, insecurity, and unhealthy behavior).

---

### THREE NEUROTIC TRENDS (CHILD'S REACTIONS)

---

#### 1. Moving toward people

Also called: Disguised hostility

Meaning: The child tries to get love and approval.

Example:

A child becomes clingy, people-pleasing, overly nice.

#### 1. Moving against people

Also called: Aggression

Meaning: The child becomes angry and controlling.

Example:

The child becomes bossy, rude, dominant.

#### 1. Moving away from people

Also called: Withdrawal

Meaning: The child becomes distant and self sufficient.

Example:

"I do not need anyone."

---

### HORNEY'S TEN NEUROTIC NEEDS

---

These are unhealthy needs people develop to deal with anxiety:

1. Need for approval
2. Need for domination
3. Need to confine life (keeping things small and safe)
4. Need for independence
5. Need for perfection
6. Need for power
7. Need to exploit others
8. Need for prestige
9. Need for ambition
10. Need for admiration

These create unhealthy relationships.

---

## HORNEY'S THREE SOCIAL STYLES

---

1. Moving toward people = clingy, needy
2. Moving against people = aggressive, controlling
3. Moving away from people = detached, cold

# ERICH FROMM

Who was he?

A psychoanalyst and social philosopher.

He said humans face a big problem:

We want freedom, but we also want belonging.

Freedom = independence

Belonging = connection, identity

So humans feel torn between:

"I want to be free"

"I want to belong"

This creates **orientations** (ways we direct our energy).

---

## FROMM'S FIVE ORIENTATIONS

---

### 1. Receptive orientation

Submissive, passive.

Example:

Waiting for others to give love, success, or direction.

### 1. Exploitative orientation

Aggressive, using others.

Example:

Taking from people without caring.

### 1. Hoarding orientation

Rigid, distrustful.

Example:

Saving everything, not sharing, resisting change.

### 1. Marketing orientation

Selling yourself socially.

Example:

Changing your personality to be liked.

### 1. Productive orientation (Healthy)

Living creatively, fully, honestly.

Example:

Using your talents, loving deeply, thinking freely.

The first four are unhealthy.

Only the productive orientation is healthy.

---

## 1. Who was Harry Stack Sullivan and why is he considered a Neo-Freudian?

### Answer:

Harry Stack Sullivan (1894–1949) was an American psychiatrist who studied personality and mental health. He is considered a Neo-Freudian because, like Freud, he focused on personality development and the unconscious, but he emphasized the role of **interpersonal relationships** rather than sexual drives. Sullivan believed that the mind and personality develop through interactions with others, especially during early childhood with the mother.

### Explanation:

Sullivan thought Freud was right that early experiences shape personality, but he shifted the focus from sexual energy to **relationships** (how people treat us and we treat them). He also drew ideas from anthropologist Ruth Benedict, which means he valued social and cultural context.

### Example:

A baby feels happy (euphoria) when fed and cared for by the mother. If the mother is anxious, the baby may feel insecure. This shows early personality is shaped by relationships.

### Tips:

- Remember: Sullivan = relationships.
  - Neo-Freudians modify Freud, don't fully reject him.
- 

## 2. What are Sullivan's three types of self?

### Answer:

Sullivan defined three aspects of the self:

1. **Good-me:** Parts we like about ourselves and can share with others; cause little anxiety.
2. **Bad-me:** Parts we dislike; associated with shame, guilt, or embarrassment.
3. **Not-me:** Parts so threatening they are pushed into the unconscious and not recognized.

**Explanation:**

These categories help us understand why people feel anxious or avoid certain thoughts. The self develops as children interact with others and learn what is socially acceptable.

**Example:**

- Good-me: "I am kind and helpful."
- Bad-me: "I lied to my friend, I feel guilty."
- Not-me: Traumatic memory blocked from awareness.

**Tips:**

- Good-me = safe and visible.
- Bad-me = hidden, triggers anxiety.
- Not-me = buried, extreme avoidance.

---

### 3. What are the three types of experience according to Sullivan?

**Answer:**

1. **Prototaxic experience:** Raw, unorganized experiences in infancy.
2. **Parataxic experience:** Emotional connections without logical order (child links events magically).
3. **Syntaxic experience:** Logical, socially validated understanding of reality.

**Explanation:**

Sullivan described how children perceive the world. Infants feel things but don't think logically. Later, they connect experiences emotionally, and eventually they learn socially agreed-upon meanings (language, rules, logic).

**Example:**

- Prototaxic: Baby feels hunger and comfort but doesn't understand cause.
- Parataxic: "I wore this shirt, it rained, so the shirt caused the rain."
- Syntactic: "Rain occurs due to clouds and weather patterns."

**Tips:**

- Think of it as a **developmental ladder**: feeling → magical thinking → logical thinking.
- 

## 4. What are Sullivan's stages of development?

**Answer:**

1. **Infancy (0-1)**: Comfort, safety, mother bond.
2. **Childhood (1-8)**: Language, communication, guidance.
3. **Juvenile era**: Playmates, social skills.
4. **Pre-adolescence (8-12)**: Close peer relationships, self-worth.
5. **Early adolescence (13-18)**: Peer influence, sexual identity.
6. **Adolescence**: Long-term relationships, identity, independence.
7. **Maturity**: Adult responsibilities, career, family, socialization.

**Explanation:**

Sullivan emphasized social relationships at each stage. If relationships fail, anxiety increases, affecting adult personality.

**Example:**

A child who struggles to form close friendships at 10 may find intimate relationships as an adult difficult.

**Tips:**

- Focus on **peer relationships** in pre-adolescence and adolescence.
  - Early bonds with caregivers are foundational.
-

## 5. Who was Karen Horney and how did she differ from Freud?

### Answer:

Karen Horney (1885–1952) was a German-American psychoanalyst. She disagreed with Freud's focus on sexuality and proposed that **basic anxiety**, caused by parental indifference or hostility, drives human behavior. Horney believed that feelings of helplessness in childhood influence adult neurosis (chronic anxiety and insecurity).

### Explanation:

Horney shifted the focus from sexual instincts to **parent-child relationships** and social environment. She studied how children cope with anxiety through specific strategies.

### Example:

A child whose parents are emotionally distant may grow up clingy, aggressive, or withdrawn.

### Tips:

- Remember: Horney = anxiety, relationships, social environment.
  - Key term: **Basic anxiety** = fear of helplessness caused by parental behavior.
- 

## 6. What are Horney's three neurotic trends?

### Answer:

1. **Moving toward people:** Seeking approval and affection (clingy, dependent).
2. **Moving against people:** Aggressive, controlling to gain power.
3. **Moving away from people:** Withdrawn, self-sufficient, avoids relationships.

### Explanation:

These are strategies children use to cope with **parental indifference or hostility**. They often carry into adult personality and relationships.

### Example:

- Moving toward: Always trying to please a partner.
- Moving against: Bullying peers to feel important.

- Moving away: Avoiding friendships to prevent hurt.

**Tips:**

- Map trends to social behavior: toward = clingy, against = bossy, away = distant.
- 

## 7. What are Horney's ten neurotic needs?

**Answer:**

1. Approval
2. Domination
3. Confinement
4. Independence
5. Perfection
6. Power
7. Exploiting others
8. Prestige
9. Ambition
10. Admiration

**Explanation:**

These needs arise from basic anxiety and shape personality and relationships. They often cause unhealthy social behavior if excessive.

**Example:**

A person obsessed with approval may become people-pleasing and unable to say no.

**Tips:**

- Remember: Neurotic needs = coping mechanisms gone extreme.
- 

## 8. Who was Erich Fromm and what is his central idea?

**Answer:**

Erich Fromm (1900–1980) was a psychoanalyst and social philosopher. He said humans face a dilemma: **we want freedom but also want to belong**. This creates tension, and people develop different orientations (ways to cope with freedom and social needs).

**Explanation:**

Freedom = independence from society's rules

Belonging = need for identity and connection

**Example:**

Someone may follow group norms even if they dislike them, just to belong.

**Tips:**

- Remember: Fromm = freedom vs. belonging dilemma.
- 

## 9. What are Fromm's five orientations?

**Answer:**

1. **Receptive:** Passive, waiting for others to give love or support.
2. **Exploitative:** Aggressive, taking from others for personal gain.
3. **Hoarding:** Distrustful, rigid, clinging to possessions or ideas.
4. **Marketing:** Adapts personality to be liked or socially approved.
5. **Productive:** Healthy, creative, uses full potential.

**Explanation:**

The first four are **neurotic orientations**; only the productive orientation is healthy and allows growth and genuine relationships.

**Example:**

- Receptive: "I need someone to tell me what to do."
- Exploitative: Uses friends to climb socially.
- Hoarding: Keeps emotions or possessions locked away.

- Marketing: Always acts to impress others.
- Productive: Lives authentically, builds healthy connections.

#### Tips:

- Productive = goal for healthy adulthood.
- Other four = ways people cope with anxiety and social pressures.

## 1. Discuss Harry Stack Sullivan's contributions to Neo-Freudian psychology.

**Answer:**

### Introduction

Harry Stack Sullivan (1894–1949) was an American psychiatrist considered a prominent Neo-Freudian. Unlike Freud, who emphasized sexual drives, Sullivan emphasized the role of **interpersonal relationships** in shaping personality.

### Key Contributions

#### 1. Personality develops through relationships

- Human personality is not only influenced by internal drives but also by social interactions.
- Early relationships, especially with the mother, are critical.

#### 2. Concept of Self

Sullivan identified **three parts of self**:

| Self Component | Description                                               | Example                                   |
|----------------|-----------------------------------------------------------|-------------------------------------------|
| Good-me        | Positive traits we like and share; reduce anxiety         | "I am helpful"                            |
| Bad-me         | Negative traits that cause anxiety                        | "I lied to my friend"                     |
| Not-me         | Extremely anxiety-provoking traits; pushed to unconscious | Traumatic memories blocked from awareness |

### 3. Modes of Experience

Sullivan outlined three ways humans experience the world:

- **Prototaxic:** Raw, unorganized sensations of infancy
- **Parataxic:** Emotional, illogical connections (magical thinking)
- **Syntactic:** Logical, socially validated understanding

### 4. Stages of Development

He proposed **seven stages** emphasizing social growth:

1. Infancy (0–1): Mother-infant bond
2. Childhood (1–8): Language, communication, guidance
3. Juvenile era: Playmates, socialization
4. Pre-adolescence (8–12): Close peer relationships
5. Early adolescence (13–18): Peer influence, sexual identity
6. Adolescence: Long-term relationships, independence
7. Maturity: Adult responsibilities, career, family

### 5. Therapy and Approach

- Worked mainly with schizophrenia.
- Used **interviews** and **empathy** as therapeutic tools.

---

#### Explanation in Simple English:

Sullivan said personality isn't just about hidden sexual drives (like Freud said) — it's about how people interact, starting from the first relationship with the mother. The "self" has three parts: good, bad, and very scary parts (hidden). Babies first experience the world in raw feelings, later in magical connections, and finally logically like adults. Social experiences at every stage shape personality. Therapy is about listening and understanding others empathetically.

#### Example:

A baby whose mother is tense may grow up anxious, feeling insecure in relationships. Therapy with empathy helps reduce this anxiety.

### Tips:

- Remember Sullivan = **relationships + self + social development**.
  - Focus on the **three selves** and **three experience modes** for exams.
- 

## 2. Explain Karen Horney's theory of neurosis and basic anxiety.

### Answer:

### Introduction

Karen Horney (1885–1952) was a Neo-Freudian psychoanalyst who disagreed with Freud's emphasis on sexual drives. She argued that **basic anxiety** caused by parental indifference or hostility is the main driver of personality problems and neurosis.

### Key Concepts

#### 1. Basic Anxiety

- Deep feeling of helplessness in a hostile world.
- Originates in childhood due to poor parental care.
- Leads to patterns of coping that may become neurotic (unhealthy).

#### 2. Neurotic Trends (Childhood Reactions)

Horney described **three strategies** children use to cope with anxiety:

| Trend                   | Description                | Example                                      |
|-------------------------|----------------------------|----------------------------------------------|
| Moving toward people    | Seeks approval, affection  | Clingy child, overly people-pleasing         |
| Moving against people   | Aggressive, controlling    | Bossy child, always fights to feel important |
| Moving away from people | Withdrawn, self-sufficient | Avoids social contact to stay safe           |

#### 3. Ten Neurotic Needs

- Excessive coping strategies shaped by anxiety: approval, domination, confinement, independence, perfection, power, exploiting others, prestige, ambition, admiration.
- Lead to dysfunctional social behavior.

#### **4. Therapy Approach**

- Identify the child's neurotic trends and needs.
- Make the person aware of these patterns.
- Help the person reduce anxiety-driven behaviors.

---

#### **Explanation in Simple English:**

Horney said that children who grow up feeling helpless and unsafe develop long-term anxiety. To cope, they either cling to people, fight people, or avoid people. These behaviors can become extreme in adulthood, making relationships difficult. Therapy involves recognizing these patterns and helping people understand and change them.

#### **Example:**

A child whose parents are emotionally distant may either become clingy in friendships (moving toward), aggressive to gain control (moving against), or emotionally detached (moving away).

#### **Tips:**

- Remember: **Anxiety → coping trend → neurotic personality.**
  - Trends: toward = clingy, against = bossy, away = distant.
- 

### **3. Describe Erich Fromm's views on freedom, belonging, and personality orientations.**

#### **Answer:**

#### **Introduction**

Erich Fromm (1900–1980) was a Neo-Freudian psychoanalyst who focused on social psychology. He proposed that humans face a fundamental dilemma:

## freedom versus belonging.

### Key Concepts

#### 1. Freedom vs Belonging

- Humans want independence (freedom) but also long for connection and security (belonging).
- Tension between these needs shapes personality.

#### 2. Orientations of Personality

Fromm identified five ways people cope with this dilemma:

| Orientation  | Description                   | Example                           | Neurotic/Healthy |
|--------------|-------------------------------|-----------------------------------|------------------|
| Receptive    | Submissive, depends on others | Waits for love or help            | Neurotic         |
| Exploitative | Aggressive, uses others       | Takes advantage of friends        | Neurotic         |
| Hoarding     | Distrustful, rigid            | Keeps possessions/emotions locked | Neurotic         |
| Marketing    | Adapts to please others       | Always acts socially acceptable   | Neurotic         |
| Productive   | Creative, self-actualized     | Lives fully, develops talents     | Healthy          |

#### 3. Therapy and Philosophy

- Fromm focused on understanding social pressures and internal conflicts.
- Later became a social philosopher, studying society and culture as well as individual psychology.

#### Explanation in Simple English:

Fromm said people struggle because they want to be free but also belong somewhere. To handle this, some people depend on others, exploit them, hoard, or act to please others — these are unhealthy patterns. Only the productive orientation is healthy, where people live creatively and fulfill their potential.

### Example:

- Receptive: "I'll do whatever you say if you love me."
- Exploitative: Uses friends for personal gain.
- Hoarding: Never trusts anyone, keeps emotions locked.
- Marketing: Always behaves to impress others.
- Productive: Lives authentically, develops talents, builds real relationships.

### Tips:

- Remember: **Four neurotic orientations + one healthy productive orientation.**
- Think freedom vs belonging = internal conflict every person faces.

## 4. Compare and contrast Sullivan, Horney, and Fromm.

### Answer:

| Psychologist | Main Focus                    | Core Idea                                                                                                    | Therapy/Applications                                        |
|--------------|-------------------------------|--------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------|
| Sullivan     | Interpersonal relationships   | Personality develops through social interactions, early mother-child bond is crucial                         | Empathy, interviews, mainly schizophrenia                   |
| Horney       | Anxiety and neurosis          | Basic anxiety from parental indifference → neurotic trends (toward, against, away)                           | Identify neurotic needs and trends, awareness               |
| Fromm        | Freedom and social philosophy | Human dilemma: freedom vs belonging; orientations (receptive, exploitative, hoarding, marketing, productive) | Understand social and personal patterns, self-actualization |

### Explanation in Simple English:

- Sullivan focuses on **relationships shaping personality.**
- Horney focuses on **anxiety and coping strategies.**

- Fromm focuses on **freedom, society, and personal growth**.

**Example:**

- Sullivan: A baby feels happy or anxious depending on mother → shapes self.
- Horney: Child feels helpless → becomes clingy, aggressive, or withdrawn.
- Fromm: Adult struggles with independence vs. belonging → develops neurotic or productive orientation.

**Tips:**

- Remember each Neo-Freudian has a **different lens**: Sullivan = relationships, Horney = anxiety, Fromm = social freedom.
- 

## 1. Simple MCQs

**Q1:** Harry Stack Sullivan emphasized that personality develops primarily through:

- A) Sexual instincts
- B) Early childhood relationships
- C) Biological maturation only
- D) Cognitive development

**Answer:** B) Early childhood relationships

**Explanation:** Sullivan believed interpersonal relationships, especially with the mother, shape personality, unlike Freud who emphasized sexual instincts.

---

**Q2:** According to Sullivan, the "Good-me" self refers to:

- A) The unconscious desires
- B) Traits that cause anxiety
- C) Positive traits we like and show to others
- D) Traumatic experiences blocked from awareness

**Answer:** C) Positive traits we like and show to others

**Explanation:** Good-me includes qualities we feel proud of and safe to share; it reduces anxiety.

---

**Q3:** Which of the following is a neurotic trend described by Karen Horney?

- A) Moving away from people
- B) Moving toward growth
- C) Moving in circles
- D) Moving against instincts

**Answer:** A) Moving away from people

**Explanation:** Horney's three neurotic trends are moving toward, against, and away from people, used to cope with anxiety.

---

## 2. True/False Statements

**Q4:** (T/F) Horney believed Freud's focus on sexual drives was the main cause of neurosis.

**Answer:** False

**Explanation:** Horney disagreed with Freud; she emphasized **basic anxiety** from parental indifference instead of sexual drives.

---

**Q5:** (T/F) Fromm's productive orientation represents a healthy personality where the individual fulfills their potential.

**Answer:** True

**Explanation:** Productive orientation is the only healthy orientation, unlike receptive, exploitative, hoarding, or marketing.

---

**Q6:** (T/F) Prototaxic experience refers to logical, socially validated understanding.

**Answer:** False

**Explanation:** Prototaxic is the raw, unorganized sensory experience of infancy. Syntactic experience is logical and socially validated.

---

## 3. Conceptual MCQs

**Q7:** Which of the following best illustrates Horney's "moving toward people" trend?

- A) A child avoids social contact to prevent hurt.
- B) A teenager bullies classmates to feel important.
- C) A young adult constantly seeks approval and attention from friends.
- D) A child refuses to acknowledge mistakes.

**Answer:** C) A young adult constantly seeks approval and attention from friends.

**Explanation:** Moving toward people is characterized by seeking affection, approval, and acceptance.

---

**Q8:** Which of the following statements correctly matches a Sullivan stage with its focus?

- A) Early adolescence: focus on career development
- B) Pre-adolescence: developing close peer relationships
- C) Infancy: long-term romantic relationships
- D) Juvenile era: focus on independence and self-actualization

**Answer:** B) Pre-adolescence: developing close peer relationships

**Explanation:** Pre-adolescence (8–12 years) focuses on forming close peer bonds to develop intimacy and self-worth.

---

**Q9:** In Fromm's theory, which orientation reflects a person who adapts behavior to please others socially?

- A) Receptive
- B) Marketing
- C) Hoarding
- D) Productive

**Answer:** B) Marketing

**Explanation:** Marketing orientation involves changing behavior to be liked or socially accepted, often neurotic.

---

## 4. Tricky / Situational MCQs

**Q10:** A child experiences parental indifference and develops a strong fear of abandonment. They respond by becoming very controlling and bossy with peers. Which Neo-Freudian concept explains this behavior?

- A) Sullivan's Good-me self
- B) Horney's moving against people trend
- C) Fromm's hoarding orientation
- D) Sullivan's parataxic experience

**Answer:** B) Horney's moving against people trend

**Explanation:** Moving against people is the aggressive response to anxiety from neglect or parental indifference.

---

**Q11:** A baby feels extremely secure when the mother is calm, but anxious when the mother is tense. Which of the following best illustrates this concept?

- A) Sullivan's interpersonal theory of self
- B) Fromm's hoarding orientation
- C) Horney's neurotic trend of moving away
- D) Freud's id, ego, superego theory

**Answer:** A) Sullivan's interpersonal theory of self

**Explanation:** Sullivan emphasized early mother-infant interactions in shaping the self and personality.

---

**Q12:** Ahmed avoids friendships because he fears being rejected. Which of the following Fromm/ Horney concepts applies?

- A) Horney's moving toward trend
- B) Horney's moving away trend
- C) Fromm's exploitative orientation
- D) Sullivan's syntactic experience

**Answer:** B) Horney's moving away trend

**Explanation:** Moving away from people is withdrawal to cope with anxiety, avoiding emotional pain.

---

**Q13:** Which scenario best illustrates a person in Fromm's productive orientation?

- A) Sara only does tasks to impress her boss.
- B) Ali hoards money and avoids change.
- C) Fatima pursues her talents, builds real relationships, and expresses creativity.
- D) Omar waits for others to tell him what to do.

**Answer:** C) Fatima pursues her talents, builds real relationships, and expresses creativity.

**Explanation:** Productive orientation is healthy, creative, and socially connected.

---

**Q14:** Which of the following is a **parataxic experience** according to Sullivan?

- A) Baby feeling hunger and comfort randomly
- B) Child believing wearing a lucky shirt causes good events
- C) Teen understanding social rules and language
- D) Adult solving problems logically

**Answer:** B) Child believing wearing a lucky shirt causes good events

**Explanation:** Parataxic experience is illogical, magical thinking, typical in childhood before understanding cause and effect.

---

**Q15:** True or False: Horney's neurotic needs only appear in childhood and disappear in adulthood.

**Answer:** False

**Explanation:** Neurotic needs develop in childhood but often persist into adulthood as patterns of behavior and social interaction.

---

## Neo-Freudians Cheat Sheet (Lessons 34 & 35)

---

### 1. Harry Stack Sullivan (1894–1949)

**Focus:** Interpersonal relationships and personality development

| Key Term                    | Definition                                      | Example                               | Memory Hook                                                                                                          |
|-----------------------------|-------------------------------------------------|---------------------------------------|----------------------------------------------------------------------------------------------------------------------|
| Interpersonal relationships | Interactions with others shape personality      | Baby feels secure when mother is calm | "Self grows with social seeds"                                                                                       |
| Good-me                     | Positive traits we like and share; low anxiety  | "I am kind"                           | Good = visible, safe                                                                                                 |
| Bad-me                      | Negative traits causing anxiety                 | Remembering a lie you told            | Bad = hidden, anxiety                                                                                                |
| Not-me                      | Extremely anxiety-provoking traits; unconscious | Repressed traumatic memory            | Not-me = buried, scary                                                                                               |
| Prototaxic experience       | Raw, unorganized sensory experience             | Baby feels hunger or comfort          | Proto = first, basic                                                                                                 |
| Parataxic experience        | Emotional/magical connections, no logic         | "Shirt brings luck"                   | Para = parallel, not connected                                                                                       |
| Syntactic experience        | Logical, socially shared understanding          | Understanding cause/effect            | Syntax = organized, rules                                                                                            |
| Seven stages of development | Infancy → maturity, focus on social growth      | Pre-adolescence = peer bonding        | Remember: I C J P E A M<br>→ Infancy, Childhood, Juvenile, Pre-adolescence, Early adolescence, Adolescence, Maturity |

### Memory Mnemonic for Self:

**Good-me** → positive

**Bad-me** → anxiety

**Not-me** → unconscious

**"Good Boys Never"**

## 2. Karen Horney (1885–1952)

**Focus:** Basic anxiety → neurosis

| Key Term        | Definition                                               | Example                        | Memory Hook                              |
|-----------------|----------------------------------------------------------|--------------------------------|------------------------------------------|
| Basic anxiety   | Feeling helpless and unsafe due to parental indifference | Child fears abandonment        | Anxiety = foundation                     |
| Neurotic trends | Childhood coping strategies for anxiety                  | Moving toward, against, away   | 3 M's: <b>Toward, Against, Away</b>      |
| Moving toward   | Seeks approval/affection                                 | Clingy child or adult          | Toward people = clingy                   |
| Moving against  | Aggression, control                                      | Bossy child, controlling adult | Against people = bossy                   |
| Moving away     | Withdrawal, self-sufficient                              | Avoids friendships             | Away from people = distant               |
| Neurotic needs  | Extreme coping behaviors                                 | Approval, power, perfection    | TEN needs → think "APP TIP MAP" mnemonic |

### **Mnemonic for Neurotic Needs:**

**A**pproval

**P**restige

**P**erfection

**T**ake control (Domination/Power)

**I**ndependence

**M**arket yourself (Marketing orientation)

**A**mbition

**P**raise/Admiration

**E**xploit others

**C**onfine life

*Tip:* Connect neurotic needs → social coping gone extreme

## **3. Erich Fromm (1900–1980)**

**Focus:** Freedom vs belonging → personality orientations

| Key Term                 | Definition                                          | Example                                  | Memory Hook                      |
|--------------------------|-----------------------------------------------------|------------------------------------------|----------------------------------|
| Freedom vs Belonging     | Human dilemma: desire for independence & connection | Wants independence but craves friendship | "Free but lonely"                |
| Receptive orientation    | Submissive, depends on others                       | Waits for love/support                   | Receptive = receive from others  |
| Exploitative orientation | Uses others aggressively                            | Uses friends to succeed                  | Exploit = take from others       |
| Hoarding orientation     | Distrustful, rigid                                  | Saves possessions/emotions               | Hoard = cling, distrust          |
| Marketing orientation    | Adapts to please society                            | Always acts liked by others              | Market = sell yourself           |
| Productive orientation   | Healthy, creative, self-actualized                  | Pursues talents and relationships        | Productive = growth + creativity |

### Memory Mnemonic:

Receive, Exploit, Hoard, Market, Produce → **REHMP**

- First four = neurotic
- Last = healthy

## 4. Quick Comparison Table

| Psychologist | Focus             | Key Concept               | Stages/Trends                        | Therapy                           |
|--------------|-------------------|---------------------------|--------------------------------------|-----------------------------------|
| Sullivan     | Relationships     | Good-me / Bad-me / Not-me | 7 developmental stages               | Interviews, empathy               |
| Horney       | Anxiety/neurosis  | Basic anxiety             | 3 neurotic trends, 10 neurotic needs | Awareness of trends               |
| Fromm        | Freedom & society | Freedom vs Belonging      | 5 personality orientations           | Social & self-actualization focus |

## 5. Small Examples (For Concept Recall)

- **Sullivan:** Baby anxious if mother tense → shapes "self"
  - **Horney:** Child avoids friends → moving away trend → adult withdrawal
  - **Fromm:** Person tries to please everyone → marketing orientation
  - **Horney Neurotic Need:** Need for approval → people-pleasing behavior
  - **Sullivan Parataxic:** "My lucky shirt brings rain"
- 

## 6. Memory Hooks & Mnemonics

**Sullivan: G-B-N** → Good-me, Bad-me, Not-me → "Good Boys Never"

**Horney: 3 M's** → Moving Toward, Against, Away → "Clingy, Bossy, Distant"

**Fromm: REHMP** → Receptive, Exploitative, Hoarding, Marketing, Productive

**Development Stages (Sullivan) Mnemonic:**

**I C J P E A M** → Infancy, Childhood, Juvenile, Pre-adolescence, Early adolescence, Adolescence, Maturity

- I = Infant bonding
  - C = Communication & guidance
  - J = Juvenile social play
  - P = Peer relationships
  - E = Early teen peer & sexual identity
  - A = Adolescence, long-term relationships
  - M = Maturity, career & family
- 

## 7. Quick Exam Tip Table

| Concept         | Exam Tip                        | Keywords to Remember     |
|-----------------|---------------------------------|--------------------------|
| Sullivan's self | Match Good/Bad/Not-me questions | Self, anxiety, awareness |

| Concept               | Exam Tip                                       | Keywords to Remember           |
|-----------------------|------------------------------------------------|--------------------------------|
| Horney trends         | Recognize moving toward/against/away scenarios | Clingy, bossy, distant         |
| Horney neurotic needs | Connect extreme coping to needs                | Approval, power, perfection... |
| Fromm orientations    | Identify behavior in scenarios                 | REHMP, freedom vs belonging    |
| Sullivan stages       | Match age & social focus                       | I C J P E A M                  |
