

Psy408 (Health Psychology)

Midterm Questions

Q1: Motivation (3 Marks)

Motivation is the internal drive that pushes a person to take action toward achieving a goal. In health psychology, motivation plays a key role in adopting and maintaining healthy behaviors, such as quitting smoking, exercising, or following a diet plan. It can be influenced by biological needs (hunger, thirst), psychological factors (desire for achievement, fear of illness), and social influences (family support, peer pressure).

Q2: Adrenal Gland (3 Marks)

The adrenal glands are small, triangular glands located on top of each kidney. They produce important hormones such as **cortisol, adrenaline, and aldosterone**. These hormones help the body respond to stress (fight-or-flight response), regulate metabolism, control blood pressure, and maintain salt and water balance. In health psychology, adrenal gland activity is studied in relation to **stress and illness**, since chronic stress can lead to overproduction of cortisol and related health problems.

Q3: Illness & Wellness (5 Marks)

Illness refers to a state where the normal functioning of the body or mind is disturbed, often due to disease, infection, or poor lifestyle choices. It may involve physical symptoms (pain, fever) and psychological effects (anxiety, depression). On the other hand, **wellness** is more than the absence of illness; it is a **holistic state of complete physical, mental, and social well-being**. Health psychology emphasizes that wellness depends on lifestyle factors such as regular exercise, balanced diet, stress management, and positive social relationships. The illness-wellness continuum explains that people can move toward better health (wellness) or worse health (illness) depending on their daily behaviors and coping strategies.

Q4. What do you know about phobia? Explain with an example

A phobia is an *intense, irrational, and persistent fear* of a specific object, situation, or activity that poses little or no actual danger. Unlike normal fear, phobias interfere with daily life because the individual actively avoids the feared stimulus and experiences extreme anxiety when exposed to it. Phobias are classified as anxiety disorders in clinical psychology.

For example, a person with **arachnophobia** (fear of spiders) may panic even when seeing a small harmless spider or even a picture of one. They might avoid going to basements, gardens, or storerooms just to reduce the possibility of encountering spiders. This avoidance leads to disturbance in normal routine and reduces quality of life.

Q5. How is social support helpful in reducing stress?

Social support refers to the emotional, informational, and practical assistance provided by family, friends, and community. Research shows that people with strong social networks cope

better with stress compared to those who feel isolated.
Social support helps in stress reduction in several ways:

1. **Emotional support** (listening, showing empathy, encouragement) reduces feelings of loneliness.
2. **Informational support** (guidance, advice, suggestions) helps in problem-solving and decision making.
3. **Instrumental support** (financial help, physical assistance) reduces the practical burden of stressful situations.
4. Having caring people around creates a sense of belonging and boosts self-esteem, which lowers stress hormones like cortisol.
For instance, a student going through exam stress may feel relaxed when friends share notes or parents encourage them with kind words.

Q6. Narrate 5 symptoms of depression

Depression is a mood disorder marked by persistent sadness and lack of interest. Some common symptoms include:

1. **Persistent low mood** – feeling sad, hopeless, or empty most of the time.
 2. **Loss of interest or pleasure** – activities that were once enjoyable no longer bring happiness.
 3. **Changes in sleep patterns** – either insomnia (difficulty sleeping) or hypersomnia (excessive sleeping).
 4. **Changes in appetite or weight** – significant weight loss/gain unrelated to dieting.
 5. **Difficulty concentrating** – trouble making decisions or focusing on tasks.
- Other possible symptoms include fatigue, feelings of worthlessness, and suicidal thoughts. If these symptoms persist for at least two weeks, they may indicate clinical depression.

Q7. A crazy question regarding nervous system (general outline)

The nervous system is the body's communication network that coordinates actions, thoughts, and emotions by transmitting signals between different parts of the body. It is divided into:

1. **Central Nervous System (CNS):** Consists of the brain and spinal cord; controls processing, decision-making, and higher cognitive functions.
2. **Peripheral Nervous System (PNS):** Connects the CNS to the rest of the body; divided into:
 - **Somatic system** (controls voluntary actions, e.g., moving your hand)
 - **Autonomic system** (controls involuntary functions like heartbeat, breathing, digestion). The autonomic system further has:
 - **Sympathetic nervous system** ("fight or flight" response, increases heart rate, releases adrenaline).
 - **Parasympathetic nervous system** ("rest and digest" response, calms the body after stress).

In short, the nervous system ensures survival by enabling quick responses to the environment and maintaining body regulation.

Q8: Intellectual Dimension of Wellness

The intellectual dimension of wellness refers to the active participation of an individual in creative, stimulating mental activities that expand knowledge and skills. It involves the ability to think critically, analyze information, and engage in lifelong learning. A person with strong intellectual wellness is curious, open to new ideas, enjoys problem-solving, and seeks out experiences that challenge their mind. For example, reading books, learning new skills, or engaging in debates all contribute to intellectual wellness. It helps in decision-making, broadening perspectives, and adapting to changes effectively.

Q9: Define Stress

Stress can be defined as the body's physical, emotional, and psychological reaction to any demand or challenge that disturbs its balance. It occurs when external or internal pressures exceed a person's ability to cope. Stress can be positive (eustress), which motivates individuals to perform better, or negative (distress), which can lead to physical and psychological problems. For example, preparing for an exam may cause stress, but it can either motivate a student to study harder or lead to anxiety if not managed properly.

Q10: Name two types of phagocytes and briefly explain them

1. **Neutrophils** – These are the most abundant type of white blood cells and act as the first line of defense. They rapidly reach the site of infection and destroy invading microorganisms by engulfing and digesting them.
2. **Macrophages** – These are large phagocytic cells that develop from monocytes. They not only engulf pathogens but also remove dead cells and stimulate other immune responses by presenting antigens to lymphocytes.

Both types of phagocytes are essential in innate immunity as they help the body to quickly neutralize infections.

Q11: Discuss Illness-Wellness Continuum

The illness-wellness continuum is a model developed by John Travis that explains wellness as a spectrum rather than a fixed state. At one end of the continuum lies **premature death** caused by illness, disability, or poor lifestyle choices, while at the other end lies **high-level wellness**, which represents optimal health and well-being. The model highlights that wellness is not only the absence of disease but also the presence of positive health habits such as good nutrition, regular exercise, emotional balance, and social involvement. An individual can move forward or backward on the continuum depending on their lifestyle choices and health practices.

Q12: Explain Network Support and Instrumental Support

- **Network Support** – This refers to the availability of social relationships that provide a sense of belonging and connection. Friends, family, and peer groups act as a support

system, helping individuals cope with stress and emotional difficulties. For example, a student who shares problems with friends feels less isolated.

- **Instrumental Support** – This type of support involves practical help in terms of services, resources, or tangible aid. It reduces the burden of stress by directly solving problems. For instance, a friend offering financial help, giving notes before exams, or helping with household chores is an example of instrumental support.

Both supports are important for maintaining psychological well-being and reducing the harmful effects of stress.

Q13: How Antibodies Fight Against Infections

Antibodies, also called immunoglobulins, are specialized proteins produced by B-lymphocytes in response to antigens (foreign substances). They fight infections through different mechanisms:

1. **Neutralization** – Antibodies bind to pathogens or toxins, preventing them from attaching to healthy cells.
2. **Opsonization** – They coat pathogens, making it easier for phagocytes to recognize and destroy them.
3. **Complement Activation** – Antibodies trigger the complement system, which creates pores in pathogens' membranes and destroys them.
4. **Agglutination** – Antibodies bind multiple pathogens together, clumping them and making them easier to eliminate.

Thus, antibodies play a vital role in adaptive immunity by recognizing and neutralizing specific infections effectively.

Q14. What is Stress?

Stress is a psychological and physiological response of the body when a person perceives a situation as threatening, challenging, or overwhelming. It arises when the demands of the environment exceed the individual's coping resources. Stress can be both **acute** (short-term, like exam stress) and **chronic** (long-term, like financial problems).

- **Biological aspect:** Stress activates the hypothalamus-pituitary-adrenal (HPA) axis, leading to the release of cortisol and adrenaline.
- **Psychological aspect:** Stress is linked with feelings of anxiety, worry, or frustration.
- **Behavioral aspect:** Stress often influences eating patterns, sleep, and performance. Overall, stress is not always negative; sometimes it motivates individuals (eustress), but excessive stress harms mental and physical health (distress).

Q15. Hippocrates' View on Health

Hippocrates, the "Father of Medicine," introduced the idea that health depends on the **balance of four humors**: blood, phlegm, yellow bile, and black bile. Illness occurred when these humors were imbalanced.

- He emphasized **natural causes** of illness instead of supernatural ones.
- He also highlighted the importance of **diet, exercise, and environment** in maintaining health.
- Hippocrates' approach laid the foundation for **modern medical science**, shifting the focus from spiritual explanations to biological and lifestyle factors.

Q16. Brief Note on Health Psychology

Health Psychology is a branch of psychology that studies how **biological, psychological, and social factors** influence health, illness, and healthcare.

- It examines how stress, behavior, and emotions affect physical health.
 - It promotes **healthy lifestyle practices** such as exercise, balanced diet, and avoiding risky behaviors.
 - Health psychologists also help patients cope with chronic illnesses (e.g., diabetes, cancer).
 - They work on prevention strategies, like health campaigns against smoking or obesity.
- In short, health psychology bridges the gap between **mind and body**, using psychological principles to improve overall well-being.

Q17. Complete Blood Flow in the Human Body

The blood flow follows a complete circuit through the body:

1. **Deoxygenated blood** from the body returns to the **right atrium** via the superior and inferior vena cava.
 2. Blood enters the **right ventricle** and is pumped to the **lungs** via the pulmonary artery.
 3. In the lungs, **gas exchange** occurs – carbon dioxide is released and oxygen is absorbed.
 4. Oxygenated blood returns to the **left atrium** through the pulmonary veins.
 5. It then enters the **left ventricle**, which pumps it into the **aorta**.
 6. From the aorta, blood is distributed to the entire body through arteries, arterioles, and capillaries.
 7. After delivering oxygen and nutrients, blood collects waste products and returns to the heart through veins.
- This continuous cycle is known as **systemic and pulmonary circulation**, essential for survival.

Q18. Divorce Impact on Children

- Children often experience emotional distress, confusion, and insecurity.
- They may show **academic decline** due to lack of concentration.
- Socially, they might struggle with **relationships and trust issues**.
- In the long run, children of divorced families are at greater risk of **anxiety, depression, and behavioral problems**.
- However, the impact depends on **parental support, communication, and post-divorce environment**.

Q19. Three Cardiovascular Disorders

1. **Hypertension (High Blood Pressure):** A condition where blood pressure remains persistently high, increasing the risk of heart attack and stroke.
2. **Atherosclerosis:** Hardening and narrowing of arteries due to fatty deposits (plaque). It restricts blood flow and can cause heart disease.
3. **Coronary Artery Disease (CAD):** Occurs when the arteries supplying blood to the heart muscle become narrowed or blocked, leading to chest pain (angina) or heart attack.

Q20. Biopsychosocial Model

This model explains health and illness through the interaction of **biological, psychological, and social factors**.

- **Biological factors:** Genetics, brain chemistry, immune system, infections.
- **Psychological factors:** Stress, coping skills, beliefs, emotions.
- **Social factors:** Family, culture, socioeconomic status, relationships.
For example, heart disease may develop not just due to genetics (biological), but also due to stress and unhealthy lifestyle (psychological), and lack of social support (social). This model is more holistic compared to the old biomedical model.

Q21. Difference Between Sympathetic and Parasympathetic Nervous System

- **Sympathetic Nervous System (SNS):** Prepares the body for “fight or flight.” It increases heart rate, dilates pupils, releases adrenaline, and redirects blood flow to muscles.
 - **Parasympathetic Nervous System (PNS):** Promotes “rest and digest.” It slows heart rate, stimulates digestion, and conserves energy.
- ☞ Both are part of the **autonomic nervous system** and maintain balance in body functions.

Q22. Difference Between Primary and Secondary Appraisal (Lazarus’ Theory of Stress)

- **Primary Appraisal:** The individual evaluates whether an event is a **threat, challenge, or harmless**. Example: A student sees an upcoming exam as either a threat (failure) or challenge (opportunity to succeed).
 - **Secondary Appraisal:** The person evaluates their **resources and coping abilities** to deal with the stressor. Example: The same student thinks, “Do I have enough time and skills to prepare?”
- Both stages determine the intensity of stress experienced.

Q23: What is Motivation?

Answer:

Motivation refers to the internal process that initiates, directs, and sustains human behavior toward achieving goals. It gives energy to actions and explains why people choose certain activities over others. Psychologists describe motivation as the force that pushes individuals to

fulfill biological needs (like hunger and sleep), psychological desires (like achievement and belonging), and social demands.

There are **two main types of motivation**:

- **Intrinsic motivation** – when a person engages in an activity because it is naturally satisfying (e.g., reading for pleasure).
- **Extrinsic motivation** – when behavior is guided by external rewards or pressures (e.g., studying to get good grades).

Motivation is a key concept in health psychology because it influences health-related behaviors such as adopting a healthy diet, exercising, quitting smoking, or following medical treatment. Without motivation, even the best health advice is often not followed.

Q24: Enlist 3 Hassles

Answer:

Daily hassles are the small, everyday problems that create stress. Unlike major life events, they occur frequently and may accumulate to affect physical and psychological health.

Examples of hassles include:

1. Conflict with family or friends.
2. Pressure from work or academic deadlines.
3. Financial difficulties such as paying bills.

Although minor individually, when hassles pile up, they increase stress levels and may negatively impact health, mood, and coping abilities.

Q25: Difference between Avoidance–Avoidance Conflict and Approach–Avoidance Conflict

Answer:

Conflicts occur when a person has to choose between competing motives or goals.

- **Avoidance–Avoidance Conflict:**
This occurs when an individual must choose between two undesirable or unpleasant options. For example, choosing between doing a boring assignment or facing punishment for not submitting it. Such conflicts often create stress because both choices feel negative.
- **Approach–Avoidance Conflict:**
This occurs when a single goal has both positive and negative aspects. For example, a person may want to eat cake (positive: taste and enjoyment) but also worry about weight gain (negative). This conflict produces mixed feelings of attraction and fear toward the same goal.

Main Difference:

Avoidance–Avoidance = two negative options.

Approach–Avoidance = one option with both positive and negative sides.

Q26: History of Health Psychology**Answer:**

Health Psychology emerged as a distinct field in the 1970s, but its roots go back much earlier.

- **Ancient Views:** Early cultures linked health with spiritual or supernatural forces. Illness was often seen as punishment from gods.
- **Hippocrates (Greek physician):** Introduced the idea that disease has natural causes, not just spiritual ones, and emphasized the balance of the four bodily humors (blood, phlegm, yellow bile, black bile).
- **Middle Ages:** Illness was again associated with religious or moral reasons.
- **Renaissance & 17th Century:** Scientific methods advanced. Descartes introduced *mind-body dualism*, separating physical and mental health.
- **19th Century:** Germ theory by Pasteur and others highlighted the biological basis of illness.
- **20th Century:** Psychologists recognized that behavior, emotions, and lifestyle choices also affect health. The **biopsychosocial model** replaced the purely biomedical model.
- **Modern Health Psychology:** Officially recognized in the late 20th century, focusing on how psychological, social, and biological factors interact in health, prevention, and treatment of illness.

Q27: Blood Transport – Briefly Describe**Answer:**

Blood transport refers to the circulation of blood throughout the body via the cardiovascular system. The heart pumps oxygen-rich blood through arteries to tissues and organs, while veins return oxygen-poor blood back to the heart.

Functions of blood transport include:

- Carrying oxygen from the lungs to body cells.
- Delivering nutrients from the digestive system to tissues.
- Removing waste products like carbon dioxide and urea.
- Transporting hormones and immune cells to regulate body functions and fight infection.
- Maintaining temperature and pH balance.

In short, blood transport is essential for survival, as it ensures that every cell of the body receives oxygen and nutrients while removing harmful wastes.

Q28: Name and explain two phagocytes (3 marks)

Phagocytes are white blood cells that protect the body by engulfing and destroying harmful pathogens. Two main types are:

1. **Neutrophils** – They are the most abundant phagocytes. They quickly reach the site of infection and ingest bacteria.
2. **Macrophages** – Larger phagocytes that not only destroy pathogens but also remove dead cells and release chemicals to activate other immune cells.

Q29. Measuring stress (3 marks)

Stress can be measured through:

1. **Self-report scales** – e.g., Holmes and Rahe Stress Scale, Perceived Stress Scale.
2. **Physiological measures** – such as heart rate, blood pressure, cortisol levels.
3. **Behavioral observation** – noting changes in sleep, eating, or daily functioning.

Q30: Avoidance-Avoidance vs. Approach-Avoidance Conflict (5 marks)

- **Avoidance-Avoidance conflict** – Person must choose between two undesirable options. Example: Deciding between paying a heavy fine or going to court.
- **Approach-Avoidance conflict** – A single option has both positive and negative aspects. Example: Accepting a high-paying job in another city (good salary but separation from family).

Q31: Discuss immune system in detail (5 marks)

The immune system defends the body against disease-causing agents. It has two main parts:

1. **Innate Immunity** (non-specific defense) – Includes skin, mucous membranes, phagocytes (neutrophils, macrophages), and natural killer cells. It provides the first line of defense.
2. **Adaptive Immunity** (specific defense) – Involves lymphocytes:
 - **B cells** → produce antibodies to attack pathogens.
 - **T cells** → kill infected cells and regulate immune responses.

The immune system works by recognizing antigens, attacking them, and developing memory for future protection.

Q32: Intellectual dimension of wellness

The intellectual dimension of wellness refers to the ability to engage in creative and stimulating mental activities. It involves lifelong learning, critical thinking, problem-solving, and the pursuit of knowledge. A person with strong intellectual wellness shows curiosity, openness to new ideas, and the ability to analyze situations logically. For example, reading books, attending workshops, learning new skills, or exploring different cultures enhances intellectual wellness. It not only sharpens memory and concentration but also helps individuals make informed decisions in daily life. Thus, intellectual wellness contributes to personal growth and adaptability.

Q33: Define stress

Stress can be defined as the body's physical, emotional, and psychological response to any demand or challenge that disrupts an individual's balance. It occurs when perceived pressure or threat exceeds a person's ability to cope. Stress can be positive (eustress), which motivates performance, or negative (distress), which can cause health problems if prolonged. Symptoms of stress include anxiety, tension, fatigue, and irritability. In psychology, stress is often studied in relation to coping strategies and its impact on both mental and physical health.

Q34: Name two types of phagocytes and briefly explain them

1. **Neutrophils:** These are the most abundant type of white blood cells and act as the first line of defense. They quickly respond to infection by engulfing and destroying bacteria, viruses, or damaged cells.
2. **Macrophages:** These are larger phagocytes that not only destroy pathogens but also clean up dead cells and present antigens to other immune cells, helping to activate adaptive immunity. They play a key role in both immediate defense and long-term immune response.

Q35: Discuss illness-wellness continuum

The illness-wellness continuum is a model developed by John Travis that describes wellness as a dynamic process, not a fixed state. It views health on a spectrum, ranging from premature death (illness) on one end to high-level wellness on the other. Movement on this continuum is influenced by lifestyle choices, behaviors, and attitudes. For example, poor nutrition, lack of exercise, or unmanaged stress may push a person toward illness, while healthy habits, positive thinking, and preventive care move them toward wellness. This model highlights that health is not just the absence of disease but the presence of physical, mental, social, and emotional well-being.

Q36: Explain network support and instrumental support

- **Network Support:** This refers to the emotional comfort and sense of belonging provided by social connections, such as family, friends, or community groups. It reduces feelings of isolation and provides encouragement during stressful times.
 - **Instrumental Support:** This type of support is practical or tangible help, such as financial assistance, providing transportation, or helping with daily tasks. For example, a friend driving you to the doctor or lending money during an emergency is instrumental support.
- Both forms of support are crucial for coping with stress and maintaining overall health.

Q37: How antibodies fight against infections

Antibodies are specialized proteins produced by B-lymphocytes in response to antigens (foreign substances like bacteria or viruses). They fight infections in several ways:

1. **Neutralization:** Antibodies bind to pathogens and block their ability to enter and damage body cells.

2. **Opsonization:** They mark pathogens for destruction, making it easier for phagocytes to recognize and engulf them.
 3. **Complement Activation:** Antibodies trigger a series of protein reactions that directly destroy microbes.
 4. **Agglutination:** They cause pathogens to clump together, reducing their spread and making removal easier.
- Through these mechanisms, antibodies play a vital role in the adaptive immune system and help protect the body from recurring infections.

Q38: Theory of Hippocrates

Hippocrates, known as the “Father of Medicine,” proposed one of the earliest theories of personality and health. He suggested that human temperament and physical health were controlled by four bodily fluids called **humors**:

1. **Blood (sanguine type):** Associated with a cheerful, active, and optimistic personality.
2. **Yellow bile (choleric type):** Associated with anger, aggression, and a passionate personality.
3. **Black bile (melancholic type):** Linked to sadness, seriousness, and a pessimistic outlook.
4. **Phlegm (phlegmatic type):** Connected with calmness, relaxation, and a passive personality.

According to Hippocrates, an imbalance of these humors caused both physical illness and changes in personality. Although modern medicine has advanced beyond this idea, Hippocrates’ theory was important because it connected mind, body, and health for the first time.

Q39: Hypothalamus and its function

The hypothalamus is a small but very important part of the brain, located below the thalamus. It acts as the body’s **control center** by linking the nervous system with the endocrine system. Major functions include:

- **Regulation of body temperature** (maintains homeostasis).
- **Control of hunger and thirst.**
- **Regulation of sleep and wake cycles.**
- **Managing emotions and behavior related to survival** such as aggression and pleasure.
- **Controlling the pituitary gland**, which in turn regulates hormones such as growth hormone, thyroid hormones, and reproductive hormones.

In short, the hypothalamus helps maintain balance in the body and keeps vital functions running smoothly.

Q40: Approach/approach conflict

Approach/approach conflict occurs when a person must choose between **two desirable or positive options**. Both choices are appealing, but the individual can select only one. For example, a student may face approach/approach conflict when choosing between two exciting job offers or deciding whether to go on a vacation to the mountains or the beach.

Although this type of conflict can cause temporary stress, it is generally considered the **least stressful conflict** because either choice leads to a positive outcome.

Q41: Illness–Wellness Continuum

The **Illness–Wellness Continuum**, developed by John Travis, explains health as a **dynamic process**, not just the absence of disease. It shows that health lies on a spectrum with two ends:

- On one end: **Premature death and illness.**
- On the other end: **High-level wellness and positive health.**

Movement along this continuum depends on a person's lifestyle, choices, and environment. For example, poor nutrition, smoking, and unmanaged stress can push a person toward illness, while regular exercise, healthy diet, stress management, and positive thinking can move them toward wellness.

This model highlights that health is an **active process**, where individuals must make conscious efforts to move toward wellness.

Q42: Blood flow in the body

Blood flow is the process by which oxygenated and deoxygenated blood circulates through the body:

1. **Right side of the heart:** Deoxygenated blood from the body enters the right atrium → right ventricle → pumped to the lungs through the pulmonary artery.
2. **In the lungs:** Blood releases carbon dioxide and absorbs oxygen.
3. **Left side of the heart:** Oxygenated blood returns to the left atrium → left ventricle → pumped out to the entire body through the aorta.
4. **Throughout the body:** Oxygen-rich blood nourishes tissues and organs. After delivering oxygen, blood becomes deoxygenated again and returns to the heart.

This continuous cycle is called **systemic and pulmonary circulation**, and it is essential for maintaining life.

Q43: Strengths and Weaknesses of SRRS (Social Readjustment Rating Scale)

The SRRS, developed by Holmes and Rahe, measures stress by rating life events according to the amount of change or adjustment they require.

Strengths:

- Provides a simple and standardized way to measure stress.
- Highlights the link between stressful life events and illness.
- Useful for research in psychology and health.

Weaknesses:

- It does not consider individual differences—what is stressful for one person may not be stressful for another.
- Ignores daily hassles, which may contribute more to stress than major life events.
- Focuses only on negative events and not on positive stress (eustress).
- Self-report nature can lead to bias or inaccuracy.

Q44: Digestive disease (example)

A common digestive disease is **Peptic Ulcer**. It is a sore that develops in the lining of the stomach or the upper part of the small intestine due to excessive stomach acid or bacterial infection (*H. pylori*). Symptoms include stomach pain, bloating, nausea, and indigestion.

Q45: Somatic function

Somatic functions are those controlled by the **somatic nervous system**, which regulates voluntary activities. These include:

- Control of skeletal muscles (movement of arms, legs, and body).
- Coordination of reflexes.
- Relaying sensory information (touch, pain, temperature) to the brain.

Somatic functions are important for daily physical activities and interaction with the environment.

Q46: Life events

Life events are major changes in a person's life that require adjustment. Examples include marriage, divorce, death of a loved one, starting a new job, or moving to a new place. These events can cause stress because they demand emotional, psychological, or physical adaptation. Some life events are positive (marriage, promotion), while others are negative (illness, job loss).

Q47: Avoidance conflict and its types

Avoidance conflict occurs when a person faces two or more options that are unpleasant or undesirable. Types include:

1. **Avoidance–Avoidance conflict:** Choosing between two negative options (e.g., doing a difficult assignment or failing a course).
2. **Approach–Avoidance conflict:** A single option has both positive and negative aspects (e.g., accepting a high-paying job that requires moving away from family).

Both types create stress and anxiety because the choices involve undesirable consequences.

Q48: Job stress

Job stress is the harmful physical and emotional response that occurs when the demands of the workplace do not match the worker's capabilities, resources, or needs. Causes include workload, long hours, lack of control, and job insecurity. Job stress can lead to anxiety, burnout, poor performance, and even physical health problems such as heart disease and hypertension.

Q49: Daily life stress management

Daily stress can be managed through several strategies:

- Time management and prioritizing tasks.
- Regular physical exercise and relaxation techniques (yoga, meditation).
- Healthy diet and adequate sleep.
- Social support from family and friends.
- Positive thinking and problem-solving approaches.

Managing daily stress helps prevent long-term mental and physical health problems.

Q50: Parts of a neuron (only names)

The main parts of a neuron are:

1. Dendrites
2. Cell body (Soma)
3. Axon
4. Myelin sheath
5. Axon terminals

Q51: Dietitian

A dietitian is a health professional who is trained in food and nutrition. They assess, diagnose, and treat diet-related health problems. Dietitians provide guidance for healthy eating, create meal plans for patients, and manage medical conditions such as diabetes, obesity, and heart disease through nutrition therapy.

Q52: Sociology and how it helps health psychology

Sociology is the study of society, social behavior, and cultural influences. It helps health psychology by showing how **social factors** such as family, community, economic status, and cultural values affect health behaviors. For example, smoking, diet, or exercise patterns are often shaped by social norms and peer influence. Understanding these factors allows health psychologists to design more effective interventions for promoting healthy lifestyles.

Q53: Motivation

Motivation is the internal process that initiates, directs, and sustains behavior. In health psychology, motivation plays an important role in encouraging individuals to adopt healthy habits, follow medical advice, and make lifestyle changes.

- **Intrinsic motivation:** Comes from within (e.g., exercising because it makes you feel good).
- **Extrinsic motivation:** Comes from external rewards (e.g., exercising to win a medal).

Q54: Define stress

Stress is the physical and psychological reaction of the body when it perceives a threat or challenge. It can be short-term (acute) or long-term (chronic). Stress activates the “fight or flight” response, releasing hormones like adrenaline and cortisol. While some stress can improve performance, too much stress can harm physical and mental health.

Q55: Name heart diseases

Common heart diseases include:

1. **Coronary artery disease (CAD):** Narrowing of the arteries that supply blood to the heart.
2. **Hypertension (high blood pressure):** Increased pressure in blood vessels.
3. **Heart failure:** The heart’s inability to pump blood effectively.
4. **Arrhythmia:** Irregular heartbeat.

Q56: Nurse practitioner vs Physician assistant

- **Nurse Practitioner (NP):** A registered nurse with advanced education who can diagnose illnesses, prescribe medication, and provide treatment.
- **Physician Assistant (PA):** A licensed professional who works under the supervision of a physician to provide medical care, conduct examinations, and prescribe treatment.

Both help improve access to healthcare but differ in training background (nursing vs medical model).

Q57: Primary appraisal vs Secondary appraisal

- **Primary Appraisal:** The individual evaluates whether an event is a threat, challenge, or harmless. For example, a student facing an exam may see it as a threat (fear of failure) or a challenge (opportunity to prove ability).
- **Secondary Appraisal:** The person evaluates their coping resources and options to deal with the stressor. For example, the student may consider whether they have studied enough or need more help.

Both processes influence the level of stress experienced.

Q58: Antigens

Antigens are foreign substances such as bacteria, viruses, or toxins that enter the body and trigger an immune response. The immune system recognizes them as “non-self” and produces **antibodies** to fight against them. Antigens are crucial for the defense system because they help the body identify harmful invaders. Vaccines also work by introducing harmless antigens to stimulate immunity.

Q59. Intellectual Dimension of Wellness

It refers to engaging in creative, stimulating mental activities to expand knowledge and skills. It includes critical thinking, problem-solving, curiosity, and lifelong learning, which help individuals make informed decisions and adapt to new challenges.

Q60. What is Motivation?

Motivation is the internal drive that initiates, directs, and sustains behavior toward achieving goals. It can be intrinsic (arising from personal interest and enjoyment) or extrinsic (driven by external rewards or pressures).

Q61. What is Myocardial Infarction?

Myocardial infarction (commonly called heart attack) occurs when blood flow to a part of the heart muscle is blocked (usually by a blood clot or plaque in coronary arteries), leading to damage or death of heart tissue due to lack of oxygen.

Q62. Spiritual Dimension of Wellness

The spiritual dimension involves seeking meaning, purpose, and harmony in life. It includes values, beliefs, faith, and practices that guide moral decisions. Spiritual wellness can be nurtured through meditation, prayer, reflection, and connecting with others, providing inner peace and resilience during stress and illness.

Q63. What Do You Know About Immune System?

The immune system is the body’s defense against harmful pathogens like bacteria, viruses, and toxins.

- **Innate immunity** (first line): physical barriers (skin, mucous), phagocytes, natural killer cells.
- **Adaptive immunity** (specific): involves lymphocytes (B-cells and T-cells). B-cells produce antibodies to neutralize pathogens, while T-cells destroy infected cells. The immune system has memory, meaning it responds faster and stronger when exposed to the same pathogen again.

Q64. Stress Among Workers

Workplace stress arises from job demands, deadlines, workload, poor working conditions, lack of support, and job insecurity. Prolonged stress can cause burnout, decreased productivity, absenteeism, and health problems such as hypertension, anxiety, and depression.

- **Causes:** long hours, role conflict, lack of control, interpersonal conflicts.
- **Effects:** both physical (headaches, heart disease) and psychological (irritability, low motivation).
- **Management:** time management, relaxation techniques, social support, organizational changes, and counseling can reduce stress.

Q65. Learned Helplessness (Briefly Explain)

- Concept developed by **Martin Seligman**.
- Occurs when a person repeatedly faces uncontrollable negative events and stops trying to change the situation, even when control is possible.
- Example: A student who keeps failing despite effort may give up studying, believing success is impossible.
- Linked with **depression, low motivation, and poor coping skills**.

Q66. Short Note on Emotions

- Emotions are **complex psychological and physiological states** involving subjective feelings, bodily arousal, and expressive behaviors.
- They help in **survival, decision-making, communication, and social bonding**.
- Example: Fear prepares body for fight/flight, happiness promotes social connection.
- Basic emotions: happiness, sadness, anger, fear, surprise, disgust.

Q67. Circulation of Blood

- Circulatory system transports **oxygen, nutrients, hormones, and removes waste**.
- **Two main loops:**
 1. **Pulmonary circulation** → Right side of heart pumps deoxygenated blood to lungs for oxygenation.
 2. **Systemic circulation** → Left side of heart pumps oxygenated blood to body tissues.
- Ensures proper supply of oxygen and nutrients for body functioning.

Q68. Causes of Increased Stress Among Workers

- **Work overload** (too much work, tight deadlines).
- **Role conflict/ambiguity** (unclear job responsibilities).
- **Job insecurity** (fear of losing job).
- **Poor work–life balance**.
- **Lack of control** over decisions.
- **Interpersonal conflicts** at workplace.
- **Monotony or lack of recognition**.

Q69. How Anthropology and Epidemiology are Related with Health Psychology

- **Anthropology:** Studies cultural practices, beliefs, and behaviors that influence health (e.g., diet, healing practices, attitudes toward illness). Helps health psychologists design culturally sensitive interventions.
- **Epidemiology:** Studies patterns, causes, and spread of diseases in populations. Provides statistical evidence about risk factors, prevalence, and prevention.
- Both fields help **health psychology** understand health from cultural and population perspectives.

Q70. Two Types of Phagocytes

1. **Neutrophils** – First responders, attack and digest bacteria and fungi. Short-lived but fast.
2. **Macrophages** – Larger, long-lived cells that engulf pathogens and dead cells; also activate other immune cells.

Q71: What is Stress?

Stress is the body's natural response to any demand, pressure, or challenge that disturbs its normal balance. It can be physical, emotional, or psychological. When a person perceives a situation as threatening or overwhelming, the body activates the "fight-or-flight" response by releasing stress hormones like cortisol and adrenaline. Stress can sometimes be positive (eustress), helping individuals stay motivated and alert, but prolonged or chronic stress negatively impacts health, causing anxiety, depression, cardiovascular problems, and weakened immunity.

Q72: Difference between Practitioner Nurse and Physician Assistant

A **Nurse Practitioner (NP)** and a **Physician Assistant (PA)** both provide advanced healthcare services but differ in training and scope.

- A Nurse Practitioner is a registered nurse with advanced education (usually a master's or doctorate in nursing). NPs focus on patient-centered care, disease prevention, and health education. They often specialize in areas like pediatrics, family health, or geriatrics, and in many regions, they can practice independently and prescribe medication.
- A Physician Assistant is trained under the medical model similar to physicians, usually completing a master's program. PAs diagnose illnesses, develop treatment plans, and assist in surgeries, but their scope of practice is typically under the supervision of a licensed doctor (depending on country laws).

In summary, NPs come from a nursing background emphasizing holistic care, while PAs follow a medical model emphasizing disease diagnosis and treatment under a physician's guidance.

Q73: Biological concept system who gave this?

The concept of the **biological system theory** was introduced by **Ludwig von Bertalanffy**, a biologist who developed the **General Systems Theory** in the mid-20th century. According to him, the human body is not a collection of isolated organs, but an interconnected biological system where each part (organs, cells, nervous system, endocrine system, etc.) interacts with others to maintain balance or homeostasis. In psychology and health sciences, this idea was later

expanded into the **biopsychosocial model by George Engel (1977)**, which explains that biological, psychological, and social factors all influence human health and illness.

Q74: Define Stress

Stress is the body's physical and psychological response to any situation perceived as challenging or threatening. It can be **positive (eustress)**, which motivates and improves performance, or **negative (distress)**, which can impair physical and mental health. Stress triggers the release of hormones like **adrenaline** and **cortisol**, affecting heart rate, blood pressure, and alertness. Chronic stress can lead to anxiety, depression, cardiovascular issues, and weakened immunity.

Q75: Define two types of Phagocytes and briefly explain them

1. **Neutrophils:** Fast-acting white blood cells that attack and destroy invading microbes, providing the first line of defense in the immune system.
 2. **Macrophages:** Larger white blood cells that engulf pathogens, remove dead cells, and present antigens to trigger adaptive immunity.
- Both are essential for fighting infections and maintaining immune system efficiency.

Q76: Define the Social Dimension of Wellness

The social dimension of wellness refers to developing healthy, supportive relationships and effectively interacting within communities. It includes:

- Maintaining positive personal and professional relationships
- Effective communication and teamwork
- Emotional support and engagement in community activities

Q77: Define Wellness, Illness, and Continuum

- **Wellness:** A proactive process of making choices toward a healthy and fulfilling life, including physical, emotional, and social well-being.
- **Illness:** A state where physical or mental health is impaired, reducing the individual's ability to function optimally.
- **Wellness-Illness Continuum:** Health is viewed on a spectrum, ranging from optimal wellness to severe illness. Individuals can move along this continuum depending on lifestyle, stress, disease, and coping mechanisms.

Q78: Define the Disorders of Renal System and Explain Them

1. **Kidney Stones (Nephrolithiasis):** Hard deposits of minerals and salts forming in the kidneys, causing pain, blockage, and sometimes infection.
2. **Urinary Tract Infections (UTIs):** Bacterial infections in the urinary system, leading to burning sensation, fever, and frequent urination.
3. **Chronic Kidney Disease (CKD):** Progressive loss of kidney function, resulting in accumulation of waste products and fluid imbalance.

These disorders disrupt the normal filtration and excretion processes, affecting overall health.

Q79: Define the Three Strengths and Three Weaknesses of the Social Readjustment Rating Scale (SRRS)

Strengths:

1. Provides a standardized measure of life event stress.
2. Highlights the connection between major life events and illness risk.
3. Easy to administer and widely applicable in research.

Weaknesses:

1. Ignores individual differences in stress perception.
2. Cultural variations are not considered.
3. Does not account for daily hassles or positive coping strategies.

Q80: Difference between Somatic and Autonomic Nervous System

- The **Somatic Nervous System (SNS)** controls voluntary movements of skeletal muscles. It sends sensory information from the body to the brain and motor commands back to muscles.
- The **Autonomic Nervous System (ANS)** regulates involuntary body functions like heartbeat, digestion, and breathing. It automatically maintains internal organ functions without conscious effort.
- SNS helps in deliberate actions, whereas ANS keeps the body stable and balanced.

Q81: Difference between Sympathetic and Parasympathetic Nervous System

- **Sympathetic Nervous System:** Prepares the body for emergency situations (“fight or flight”), increases heart rate, dilates pupils, and redirects blood to muscles.
- **Parasympathetic Nervous System:** Promotes relaxation (“rest and digest”), slows heart rate, stimulates digestion, and helps conserve energy.
- Together, they maintain balance and help the body respond to stress or recovery.

Q82: Intellectual Dimension of Wellness

- This dimension refers to a person’s ability to think clearly, learn new skills, solve problems, and make informed decisions.
- It includes curiosity, creativity, reasoning, critical thinking, and continuous learning.
- Intellectual wellness encourages exploring ideas and adapting to new experiences effectively.

Q83: Three Scales of Life Events

1. **Social Readjustment Rating Scale (SRRS):** Measures stress from major life events, assigning “life change units” to each event.
 2. **Daily Hassles Scale:** Evaluates minor daily stressors that accumulate and affect mental health.
 3. **Life Experiences Survey (LES):** Records positive and negative life events and their psychological impact.
- These scales help researchers and practitioners understand stress levels and their effects.

Q84: How Job Creates Stress

- Jobs can create stress due to high workload, tight deadlines, and long hours.
- Role ambiguity or conflicting responsibilities can increase mental strain.
- Lack of control, poor social support, and high expectations also contribute.
- Chronic workplace stress can affect physical health, mental well-being, and job performance.

Q85: Define Motivation

- Motivation is the force that energizes, directs, and sustains behavior toward achieving goals.
- **Intrinsic Motivation:** Comes from personal interest, enjoyment, or satisfaction.
Example: Learning a new skill for pleasure.
- **Extrinsic Motivation:** Comes from external rewards such as money, recognition, or praise.
- Motivation determines effort, persistence, and focus in achieving tasks.

Q86: Write a Stressful Experience in Your Life

- Describe a personal situation causing mental, emotional, or physical tension.
- Example: Preparing for final exams with tight deadlines, feeling anxious and losing sleep.
- Include your emotional response (fear, worry), physical response (headache, tension), and coping strategy (planning, seeking support, meditation).

Q87: Neck Gland, Its Hormone, and Disease

- **Gland:** Thyroid
- **Hormones:** Thyroxine (T4) and Triiodothyronine (T3), which regulate metabolism and growth.
- **Diseases:** Hypothyroidism (low hormone levels causing fatigue, weight gain) and Hyperthyroidism (high hormone levels causing anxiety, weight loss).
- Proper thyroid function is essential for energy regulation and overall health.

Q88: What is Psychosomatic

- Psychosomatic conditions are physical illnesses caused or worsened by psychological factors like stress, anxiety, or emotional conflict.
- Examples: Stress-induced headaches, high blood pressure, stomach ulcers.
- The mind and body are connected, so emotional health directly impacts physical health.

Q89: How Do You Cope with Stress in Your Life

- Effective coping strategies include exercise, meditation, deep breathing, and mindfulness.
- Social support from friends or family helps reduce emotional strain.
- Time management, positive thinking, and problem-solving skills prevent stress from becoming overwhelming.
- Healthy lifestyle habits like proper sleep, nutrition, and relaxation activities improve resilience.

Q90: What is Primary and Secondary Appraisal

- **Primary Appraisal:** Evaluating whether an event is threatening, challenging, or harmless. Example: Seeing a big exam → “This is stressful.”
- **Secondary Appraisal:** Evaluating resources and coping options to manage the stressor. Example: “I can handle it by preparing daily and asking for help.”
- Both appraisals determine emotional responses and coping effectiveness.

Q91: How Sociology and Epidemiology Are Related to Health Psychology

- **Sociology:** Studies how social interactions, culture, and community affect health behavior and wellness.
- **Epidemiology:** Examines patterns, causes, and effects of diseases in populations.
- **Relation:** Social factors influence disease distribution, which is analyzed by epidemiology, helping health psychologists design interventions.

Q92: How Antibodies Work Against Antigens

- Antibodies are proteins produced by B-cells that identify and neutralize foreign antigens (pathogens).
- They bind to antigens, preventing them from infecting cells and marking them for destruction by phagocytes.
- This immune response protects the body from infections and builds immunity for future exposure.

Q93: Write one name of infectious disease and one dietary disease

- **Infectious disease: Tuberculosis (TB)** – caused by bacteria, spreads through air, affects lungs. Symptoms include cough, fever, weight loss.
- **Dietary disease: Scurvy** – caused by vitamin C deficiency, leads to fatigue, bleeding gums, and poor wound healing.

- Infectious diseases are transmitted from person to person, while dietary diseases result from nutrient deficiencies.

Q94: What is the Role of Psychology in Health and Illness

- Psychology studies how behavior, emotions, and thoughts influence physical health.
- Helps understand stress, coping mechanisms, and health-related behaviors like diet, exercise, and adherence to treatment.
- Psychologists design interventions to reduce stress, improve mental health, and promote healthy lifestyle choices.
- In illness, psychology helps patients manage pain, adjust to chronic diseases, and improve overall well-being.

Q95: Write a Detailed Note on Forehead

- The **forehead** is the frontal part of the skull above the eyes and is part of the **frontal lobe of the brain**.
- It plays a major role in **cognitive functions** such as decision-making, problem-solving, planning, and controlling behavior.
- It also regulates emotions, personality traits, and voluntary movements.
- In health psychology, the frontal lobe is important because stress, emotions, and cognitive workload can affect its functioning, influencing behavior and mental health.

Q96: How Stressors Have a Great Effect on Life Events

- Stressors are events or conditions that challenge an individual's ability to cope.
- Life events like job loss, exams, or illness become more stressful depending on intensity, duration, and personal perception.
- Chronic or repeated stressors can affect physical health (blood pressure, immunity) and mental health (anxiety, depression).
- Stressful life events can trigger maladaptive behaviors or worsen existing health conditions, highlighting the importance of coping strategies.

Q97: Biopsychosocial Model of Health

- This model explains health as the result of **biological, psychological, and social factors**.
- **Biological:** Genetics, brain function, hormones, immune system.
- **Psychological:** Emotions, stress, coping strategies, personality.
- **Social:** Family support, culture, socioeconomic status, environment.
- Health psychologists use this model to understand illness, plan interventions, and promote overall wellness.

Q98. Method name in which stress is measured? (3 Marks)

Stress is commonly measured using the **Self-Report Method**. In this method, individuals report their own level of stress by filling out questionnaires or scales such as the **Perceived Stress Scale**

(PSS). These tools measure how stressful people find their life situations. Stress can also be measured through **physiological methods**, which include heart rate, blood pressure, and cortisol level to assess the body's stress response.

Q99. Role of Hypothalamus (3 Marks)

The hypothalamus is an important part of the brain that helps maintain **homeostasis** in the body. It plays a major role in the **stress response** by activating the autonomic nervous system and the endocrine system. The hypothalamus stimulates the pituitary gland to release hormones that prepare the body for stress. It also regulates body temperature, hunger, thirst, and sleep.

Q100. Difference between Parasympathetic and Sympathetic Nervous System (5 Marks)

The sympathetic and parasympathetic nervous systems are two divisions of the **autonomic nervous system**, but they have opposite functions.

The **sympathetic nervous system** becomes active during stress or emergency situations. It prepares the body for the **fight or flight response** by increasing heart rate, raising blood pressure, dilating pupils, and slowing digestion.

In contrast, the **parasympathetic nervous system** is active during normal and relaxed conditions. It helps the body return to a **rest and digest** state by slowing the heart rate, promoting digestion, and conserving energy. Both systems work together to maintain balance in the body.

Q101. Primary and Secondary Appraisal (5 Marks)

Primary and secondary appraisal are key concepts in **Lazarus' cognitive appraisal theory of stress**.

Primary appraisal refers to the individual's evaluation of a situation to determine whether it is stressful, harmful, threatening, or harmless. If the situation is perceived as a threat, stress is experienced.

Secondary appraisal involves evaluating one's ability to cope with the stressor. In this stage, the person assesses available resources and coping strategies. If the individual believes they can manage the situation, the level of stress is reduced.

Q102. How do you manage stress? Give examples. (Short Question)

Stress can be managed by using effective coping strategies. One common method is **relaxation techniques** such as deep breathing and meditation, which help calm the mind and body. Another way is **time management**, where tasks are planned and prioritized to reduce pressure. For example, a student can reduce exam stress by making a study timetable and taking short breaks. **Physical activity**, such as walking or exercise, also helps reduce stress by releasing tension.

Q103. Write a note on emotions. (Short Question)

Emotions are psychological states that involve **feelings, thoughts, and physiological reactions**. They play an important role in influencing behavior and health. Common emotions include happiness, anger, fear, and sadness. Emotions affect how people respond to stress and cope with daily life challenges. Positive emotions can improve well-being, while negative emotions, if experienced for a long time, can negatively affect physical and mental health.

Q104. History of Health Psychology. (Long Question)

Health psychology developed as a distinct field in the **1970s**, when psychologists began to recognize that health and illness are influenced by psychological, social, and behavioral factors, not only biological causes. Earlier, the **biomedical model** focused mainly on physical factors such as germs and disease.

The emergence of the **biopsychosocial model** emphasized the interaction of biological, psychological, and social factors in health. In 1978, the **American Psychological Association (APA)** officially recognized health psychology as a specialty area. Since then, health psychology has focused on stress, lifestyle behaviors, illness prevention, and health promotion. Today, it plays an important role in understanding how behavior and emotions affect physical health.

Q105. Strengths and Weaknesses of SRRS. (Long Question)

The **Social Readjustment Rating Scale (SRRS)**, developed by **Holmes and Rahe**, is used to measure stress by identifying major life events that require adjustment.

Strengths of SRRS

One major strength of SRRS is that it provides a **simple and standardized way** to measure stress. It helps identify how life events such as marriage, divorce, or job change contribute to stress levels. The scale is easy to use and is widely applied in health psychology research to predict stress-related illness.

Weaknesses of SRRS

A key weakness of SRRS is that it does not consider **individual differences** in how people perceive and cope with stress. The same event may be stressful for one person but not for another. It also ignores daily hassles and focuses only on major life events. Additionally, the scale assumes that life changes are equally stressful for everyone, which reduces its accuracy.

Q106. Method's name in which stress is measured? (Short Question)

Stress is commonly measured using the **Self-Report Method**. In this method, individuals assess and report their own level of stress through questionnaires or rating scales such as the **Perceived Stress Scale (PSS)** and **Social Readjustment Rating Scale (SRRS)**. Stress can also be measured through **physiological methods**, including heart rate, blood pressure, and cortisol levels, which indicate the body's stress response.

Q107. Role of Dietician? (Short Question)

A dietician plays an important role in promoting health by planning **balanced and nutritious diets** according to individual needs. Dietitians help people manage health conditions such as obesity, diabetes, and heart disease through proper nutrition. They also educate individuals about healthy eating habits, meal planning, and lifestyle changes to prevent illness and improve overall well-being.

Q108. Avoidance–Avoidance Conflict. (Long Question)

Avoidance–avoidance conflict is a type of psychological conflict in which an individual must choose between **two equally undesirable options**. In this situation, both choices are unpleasant, and the person tries to avoid making a decision.

This type of conflict creates stress and anxiety because avoiding one option brings the individual closer to the other negative option. For example, a student may face avoidance–avoidance conflict when choosing between **failing an exam** or **retaking a difficult course**. In both cases, the outcomes are negative, so the individual experiences psychological tension.

Q109. History of Health Psychology. (Long Question)

Health psychology emerged as a separate field in the **1970s**, when psychologists began to study how psychological and behavioral factors influence health and illness. Before this, the **biomedical model** dominated, focusing mainly on biological causes of disease.

Later, the **biopsychosocial model** was introduced, emphasizing that health is influenced by biological, psychological, and social factors. In **1978**, the American Psychological Association (APA) formally recognized health psychology as a specialty area. Since then, health psychology has focused on stress, health behaviors, illness prevention, and health promotion, making it an important field in modern healthcare.

Q110. How do you manage stress? (Short Question)

Stress can be managed by using effective coping strategies. One common method is **relaxation techniques** such as deep breathing and meditation, which help calm the body and mind. **Time management** also helps reduce stress by organizing tasks and setting priorities. For example, making a daily schedule can reduce work or study pressure. Regular **physical exercise** and talking to supportive friends or family members also help in managing stress.

Q111. Intellectual Dimension of Wellness (Short Question)

The intellectual dimension of wellness refers to the ability to **think creatively, learn new skills, and use critical thinking**. It involves being open to new ideas, solving problems effectively, and making informed decisions. This dimension encourages continuous learning through reading, education, and mental activities. Intellectual wellness helps individuals adapt better to challenges and improves overall quality of life.

Q112. Biological Aspect of Stress (Long Question)

The biological aspect of stress explains how the body reacts to stressful situations. When a person experiences stress, the **hypothalamus** activates the **autonomic nervous system** and the **endocrine system**. The sympathetic nervous system triggers the **fight or flight response**, increasing heart rate, blood pressure, and breathing rate.

At the same time, the hypothalamus stimulates the **pituitary gland**, which activates the **adrenal glands** to release stress hormones such as **adrenaline and cortisol**. These hormones prepare the body to deal with stress by providing extra energy. However, prolonged stress can weaken the immune system and increase the risk of physical illness.

Q113. Illness–Wellness Continuum (Long Question)

The illness–wellness continuum is a model that explains health as a **dynamic process** rather than a fixed state. It shows that individuals move along a continuum ranging from **premature death and illness** at one end to **optimal wellness** at the other end.

According to this model, absence of disease does not necessarily mean good health. Positive lifestyle behaviors such as regular exercise, balanced diet, stress management, and positive thinking help individuals move toward wellness. Poor habits and chronic stress can move a person toward illness. The model emphasizes personal responsibility in maintaining and improving health.

Q114. Write three digestive disorders. (Short Question)

Three common digestive disorders are:

1. **Gastritis** – inflammation of the stomach lining that causes pain and discomfort.
2. **Irritable Bowel Syndrome (IBS)** – a disorder affecting the large intestine, causing abdominal pain, diarrhea, or constipation.
3. **Peptic Ulcer** – open sores that develop in the stomach or small intestine due to acid damage.

Q115. Define Asthma. (Short Question)

Asthma is a **chronic respiratory disease** in which the airways become inflamed and narrowed, making breathing difficult. It is characterized by symptoms such as wheezing, coughing, shortness of breath, and chest tightness. Asthma attacks can be triggered by allergens, stress, or physical activity.

Q116. Spiritual Dimension of Wellness. (Long Question)

The spiritual dimension of wellness refers to a person's sense of **meaning, purpose, and connection** in life. It involves having values, beliefs, and principles that guide behavior and provide inner peace. Spiritual wellness does not necessarily involve religion; it may include practices such as meditation, prayer, self-reflection, and appreciation of nature.

A spiritually well person feels a sense of harmony with themselves and others, which helps in coping with stress and life challenges. This dimension promotes hope, inner strength, and emotional balance, contributing to overall health and well-being.

Q117. Briefly describe Antigens. (Long Question)

Antigens are **foreign substances** that enter the body and trigger an **immune response**. They are usually found on the surface of bacteria, viruses, or other harmful microorganisms. When antigens enter the body, the immune system recognizes them as harmful and produces **antibodies** to destroy or neutralize them.

Antigens play an important role in activating the body's defense system and protecting against infections. However, in some cases, harmless substances such as pollen or dust can act as antigens and cause allergic reactions.

Q118. How do antibodies fight against antigens? (Short Question)

Antibodies fight against antigens by **recognizing and binding** to them. Once attached, antibodies neutralize harmful substances or mark them for destruction by white blood cells. This process helps the immune system protect the body from infections.

Q119. Role of Nutritionist (Short Question)

A nutritionist helps people maintain good health by advising on **balanced and healthy diets**. They plan meals according to individual needs and help prevent or manage diseases such as obesity, diabetes, and heart problems. Nutritionists also promote healthy lifestyle and eating habits.

Q120. Adrenal Gland (Long Question)

The adrenal glands are small glands located **on top of each kidney**. They play an important role in the body's **stress response**. The adrenal glands release hormones such as **adrenaline and cortisol**, which prepare the body to deal with stress.

Adrenaline increases heart rate, blood pressure, and energy levels, while cortisol helps regulate metabolism and immune response. These hormones support the **fight or flight response**, allowing the body to respond effectively to stressful situations.

Q121. Learned Helplessness and who gave the concept (Long Question)

Learned helplessness is a psychological condition in which a person believes that **nothing they do can change a negative situation**. As a result, the person stops trying to improve or escape the situation, even when opportunities are available.

The concept of learned helplessness was given by **Martin Seligman**. It is commonly associated with depression, stress, and lack of motivation, and plays an important role in understanding mental health in health psychology.

Q122. How divorce stresses children? (Short Question)

Divorce can stress children because it disrupts their **family stability and routine**. Children may feel **sadness, anger, confusion, or guilt**. They might also experience anxiety, trouble in school, or difficulty trusting others. The emotional support of parents and clear communication can reduce these stress effects.

Q123. Brief note on motivation (Short Question)

Motivation is the **internal or external drive** that encourages a person to act and achieve goals. It can be **intrinsic** (coming from within, like personal satisfaction) or **extrinsic** (driven by rewards, recognition, or pressure). Motivation helps people overcome challenges and maintain focus on tasks or health behaviors.

Q124. Write one experience of your life that developed stress (Long Question – Personal Example)

For example:
During exams, I felt **intense stress** because of the fear of failing and heavy workload. I experienced **sleep difficulties, headaches, and anxiety**, which affected my concentration. I learned to manage stress by **making a study schedule, taking short breaks, and practicing deep breathing**. This experience helped me understand the importance of time management and coping strategies in reducing stress.

Q125. Role of Health Psychology (Long Question)

Health psychology studies how **behavioral, psychological, and social factors** affect health and illness. Its main roles include:

1. **Promoting Healthy Behaviors** – Encouraging exercise, balanced diet, stress management, and quitting smoking.
2. **Preventing Illness** – Educating people about lifestyle changes to reduce risk of chronic diseases.
3. **Managing Stress and Coping** – Helping individuals cope with stress, chronic illness, or medical procedures.
4. **Improving Patient Care** – Working with medical professionals to improve adherence to treatment and patient outcomes.
5. **Research and Policy** – Conducting studies to understand health behavior and advising public health policies.

Health psychologists play a crucial role in enhancing well-being and quality of life.

Q126. Immune System (Long Question)

The immune system is the body's **defense system** against infections and diseases. It consists of **white blood cells, antibodies, and organs** like the thymus, spleen, and bone marrow.

- **Antigens** are foreign substances that trigger an immune response.
- **Antibodies** are proteins produced to neutralize or destroy antigens.
- The immune system includes **innate immunity** (natural defense, e.g., skin, enzymes) and **adaptive immunity** (learned defense against specific pathogens).

A strong immune system protects the body, while a weak immune system increases vulnerability to infections and illnesses.

Q127. Discuss the GAS developed by Selye (Long Question)

GAS (General Adaptation Syndrome) is a model developed by **Hans Selye** to explain the body's response to stress. It has three stages:

1. **Alarm Stage** – The body recognizes stress and activates the **fight or flight response**, releasing adrenaline and cortisol.
2. **Resistance Stage** – The body tries to **adapt to the stressor**. Stress hormones remain elevated, and energy is used to cope.
3. **Exhaustion Stage** – Prolonged stress leads to **depletion of physical resources**, resulting in fatigue, illness, or weakened immunity.

GAS explains how stress affects both **physical and psychological health** over time.

Q128. Life Cycle – Three Scales (Short Question)

Life cycle can be assessed using **three common scales**:

1. **Childhood Development Scales** – Measure physical, cognitive, and emotional growth in children.
2. **Adolescent Adjustment Scales** – Assess mental, emotional, and social adaptation during teenage years.
3. **Adult & Aging Scales** – Evaluate health, stress, and psychological well-being in adults and older adults.

Q129. Biological Stress in Life (Long Question)

Biological stress refers to the **body's physical response to stressors**. When a person faces stress, the **hypothalamus** activates the **sympathetic nervous system** and the **endocrine system**.

- The **adrenal glands** release **adrenaline and cortisol**, preparing the body for “fight or flight.”
- Heart rate, blood pressure, and breathing increase.
- Prolonged biological stress can weaken the immune system, disrupt sleep, and increase risk of illnesses such as hypertension or diabetes.

Biological stress is therefore the body's natural reaction, but chronic stress can be harmful.

Q130. Biological and Psychological Effects of Stress (Long Question)

Stress affects both **body and mind**:

Biological Effects:

- Increased heart rate and blood pressure
- Elevated stress hormones like cortisol
- Weakening of the immune system
- Headaches, fatigue, or digestive problems

Psychological Effects:

- Anxiety, fear, or depression
- Irritability and mood swings
- Difficulty in concentration and memory
- Low motivation or learned helplessness

Q131. Neurons and its Types (Long Question)

Neurons are **nerve cells** that transmit information in the brain and body. They consist of a **cell body, dendrites, and axon**.

Types of Neurons:

1. **Sensory Neurons** – Carry signals from sense organs to the brain.
2. **Motor Neurons** – Carry commands from the brain to muscles and glands.
3. **Interneurons** – Connect sensory and motor neurons and process information within the brain or spinal cord.

Q132. Lazarus' Theory (Long Question)

The question likely refers to **Lazarus' Cognitive Appraisal Theory of Stress**.

- According to Lazarus, stress depends on **how a person appraises a situation**.
- **Primary appraisal**: The person evaluates if the situation is threatening, harmful, or challenging.
- **Secondary appraisal**: The person evaluates their ability to cope with the stressor using available resources.

Stress arises when the situation is perceived as **threatening** and coping resources are **insufficient**.

Q133. Thalamus (Short/Long Question)

The **thalamus** is a part of the brain located **above the brainstem**. It acts as a **relay station** for sensory and motor signals. All sensory information (except smell) passes through the thalamus before reaching the **cerebral cortex** for processing.

Roles of the Thalamus:

- Relays sensory information to the appropriate brain areas.
- Regulates **consciousness, attention, and alertness**.
- Plays a role in **sleep and wakefulness**.
- Helps in **coordinating voluntary movements** by connecting motor signals.

The thalamus is essential for **perception, awareness, and proper body functioning**.
