EDU601 GDB Fall 2024 Solution

Q: "How can you apply Maria Montessori's idea of 'learning through hands-on activities' to teach a basic concept in any subject? Give one example.3. Your comments should not exceed 100-150 words.

Maria Montessori's idea of "learning through hands-on activities" can be applied effectively in various subjects. For example, in mathematics, teaching the concept of fractions can be enhanced through hands-on activities. Using fraction circles or fraction bars, students can physically manipulate and visualize fractions. They can combine, compare, and divide the pieces to understand how different fractions relate to each other and to whole numbers. This tactile experience makes abstract concepts more concrete, helping students grasp the idea of fractions intuitively and retaining the knowledge better. Through hands-on learning, students engage actively, making the learning process more interactive and enjoyable.

Moreover, ensuring clear, concise, and unbiased questions is critical to obtaining valid and reliable data. Avoiding jargon and complex language makes the questionnaire accessible to all respondents. Pre-testing the questionnaire can identify potential issues and improve clarity. Effective questionnaire design ultimately leads to more accurate and meaningful insights. Remember, the goal is to gather data that truly reflects respondents' views and experiences.
