Question # 1 of 15 (Start time: 03:24:00 PM, 30 January 2023)

Development view in Krutchen's 4+1 architectural view model captures

Paid Service Available

Q: #1

Select the correct option

○	Mapping(s) of the software onto the hardware and reflects its distributed aspect
○	Static organization of the software in its development environment Correct
○	Object model of the design
○	Concurrency and synchronization aspects of the design

Explanation :

The correct option is: **Static organization of the software in its development environment**.

The Development View in Krutchen's 4+1 architectural view model focuses on the static organization of the software in its development environment, including the structure of the code, the modules, and their interrelationships. It provides an understanding of how the software is constructed and organized during its development process.

Question # 2 of 15 (Start time: 03:25:47 PM, 30 January 2023)

Vertical partitioning is also known as.....

Paid Service Available

Q: #2

Select the correct option

- Mutating
- Parallelizing
- Balancing
- Factoring

Correct

Explanation :

The correct option is: **Factoring**.

Vertical partitioning, also known as factoring, is a software design technique that involves dividing a program into smaller parts, or components, based on functional boundaries. Each component has a distinct and well-defined purpose, and they work together to perform the desired functionality of the program. The goal of vertical partitioning is to make the software more maintainable and reusable.

Question # 3 of 15 (Start time: 03:26:50 PM, 30 January 2023)

When a class gets physical existance in computer memory, it is called

Paid Service Available

Q: #3

Select the correct option

- ○ Parent Class
- ○ Static Object
- ○ Object — Correct
- ○ polymorphism

Explanation :
The correct option is: **Object**.
In object-oriented programming, a class is a blueprint for creating objects. When a class is instantiated, or when an object is created based on the class, the object gets a physical existence in computer memory. This object is called an instance of the class, and it holds its own data and functions. The term "object" refers to this physical representation of a class.

Question # 4 of 15 (Start time: 03:28:15 PM, 30 January 2023)

A _____ relationship indicates that one entity is composed of one or more parts which are themselves instances of that or another entity.

Paid Service Available

Q: #4

Select the correct option

- Inheritance
- Whole-part — Correct
- Generalization
- Specialization

Explanation :

The correct option is: **Whole-part**.

The whole-part relationship, also known as the composition relationship, indicates that one entity is composed of one or more parts which are themselves instances of that or another entity. This relationship is used to model complex structures where an object is composed of other objects. The whole-part relationship is often represented as an arrow pointing from the whole to the parts. The parts are considered part of the whole, and if the whole is deleted, the parts are also deleted.

Question # 5 of 15 (Start time: 03:29:10 PM, 30 January 2023)

Thin Client Model is one of the configurations of .....Model.

Paid Service Available

Q: #5

Select the correct option

- Client Server — Correct
- Layered
- Reference
- Data-centered

Explanation :

The correct option is: **Client-Server**.

The Thin Client Model is one of the configurations of the Client-Server Model. In the Thin Client Model, most processing is performed on the server, and the client is responsible for presenting the data to the user and sending user input back to the server. The client device, known as a "thin client," has limited processing power and relies on the server for most processing tasks. This configuration is often used in cloud computing and terminal services where many clients access a shared server.

Question # 6 of 15 (Start time: 03:30:06 PM, 30 January 2023)

A self documenting code is a code that explains itself without the need of comments and extraneous documentation, like _____

Paid Service Available

Q: #6

Select the correct option

○	All of the given choices Correct
○	Process-flow state diagrams
○	Flowcharts
○	UML diagrams

Explanation :

The correct option is: **All of the given choices**.

A self-documenting code is a code that explains itself without the need of comments and extraneous documentation. It is written in a way that makes it easy to understand and maintain, and it is structured in a clear and concise manner. This type of code is often achieved by using clear and descriptive variable names, well-structured control flow statements, and meaningful function names. The use of diagrams such as process-flow state diagrams, flowcharts, and UML diagrams can also help to make code self-documenting.

Question # 7 of 15 (Start time: 03:31:21 PM, 30 January 2023)

Q: #7

```
if (e.Title() == "CEO" || e.Salary() > 10000)
in the above statement if (e.Title()=="CEO") is TRUE then
```

Paid Service Available

Select the correct option

- Second part is not evaluated but e.Salary() is called
- Second part is not evaluated — Correct
- Second part is always evaluated
- Second part must also be TRUE

Explanation :

The correct option is: **Second part is not evaluated**.

In the above statement, if the condition (e.Title() == "CEO") is true, then the second part of the condition (e.Salary() > 10000) is not evaluated, as the overall result of the condition has already been determined. This is due to the short-circuit evaluation of logical operators in most programming languages. When the result of a logical expression can be determined from evaluating only part of the expression, the rest of the expression is not evaluated to save processing time and improve efficiency.

Paid Service (Quiz, Assignments & Other Activities) Available of All Subject Contact on WhatsApp

Question # 8 of 15 (Start time: 03:38:39 PM, 30 January 2023)

Q: #8

The expressions with logical operators can be evaluated only from _____.

Paid Service Available

Select the correct option

- Top to bottom
- Left to right — Correct
- Bottom to top
- Right to left

Explanation :

The correct option is: **Left to right**.

In most programming languages, the expressions with logical operators are evaluated from left to right. For example, in the expression (A && B || C), A is evaluated first, followed by B if A is true, and then C if B is false and A is true. This order of evaluation is determined by the precedence and associativity rules of the logical operators in the expression. By evaluating the expressions from left to right, the logical operators can determine the final result of the expression without evaluating all the parts of the expression.

STL Stnads for ----------

Paid Service Available

Q: #9

Select the correct option

- ( ) Standard Template Library — Correct
- ( ) Standard Tempo Line
- ( ) Standard Type Link
- ( ) Standard Type Link

Explanation :

The correct option is: **Standard Template Library**.
STL stands for Standard Template Library, which is a library of generic algorithms and data structures in the C++ programming language. STL provides a set of powerful and flexible components that can be used to build complex data structures and algorithms with ease. The library is designed to work with any data type that meets certain requirements, known as the "container concept" and "iterator concept". This makes STL highly reusable and adaptable to a wide range of programming tasks.

Question # 10 of 15 (Start time: 03:45:36 PM, 30 January 2023)

Q: 10

Be very careful when you use functions with side effects – functions that change the values of the

_ _ _ _ _ _ _ _

Paid Service Available

Select the correct option

- Classes
- Structures
- Variables — Correct
- Objects

Explanation :

The correct option is: **Variables**.

Functions with side effects are functions that change the values of the variables. These functions can have unintended consequences, especially if they are used in unexpected ways or in combination with other functions. It is important to be aware of the side effects of a function and to use them carefully in order to avoid unintended results. When you are writing or using functions with side effects, you need to be mindful of the order in which the functions are called, and to consider the impact of the side effects on the values of the variables.

Question # 11 of 15 (Start time: 03:46:56 PM, 30 January 2023)

Q: 11

Sequence of messages can be present in:
a. Use case diagram
b. Sequence diagram
c. Collaboration diagram

Paid Service Available

Select the correct option

- a only
- b only — Correct
- c only
- b and c

Explanation :
The correct option is **b only** (Sequence diagram)
A sequence diagram is a type of interaction diagram that shows the order of interactions between objects or components in a system. It is used to model the dynamic behavior of a system, specifically the order of messages exchanged between objects. The sequence diagram shows the interactions between objects as a time-ordered sequence of messages, indicating the objects involved in the interactions, the order of the interactions, and the lifecycle of any objects created or destroyed during the interactions.

Question # 12 of 15 (Start time: 03:48:24 PM, 30 January 2023)

Specialization means:

Paid Service Available

Q: 12

Select the correct option

○	Creating new subclasses from an existing class Correct
○	Hiding the data
○	Abstraction
○	Calling the same method with object of child object

Explanation :

The correct option is: **Creating new subclasses from an existing class**.

Specialization means creating new subclasses from an existing class, where the new class has more specific features and characteristics as compared to the parent class. It allows for the creation of more refined classes based on the existing ones, which can then be used to model more complex and specific scenarios.

Question # 15 of 15 (Start time: 03:56:12 PM, 30 January 2023)

Paid Service Available

Q: 14

In Object oriented design, combining the services offered by an object with the attributes they work on, results in:

a. Lower coupling and stronger cohesion
b. Lower cohesion and stronger coupling
c. Increased likelihood of reuse
d. Decreases the modularity of the system

Option **a only**: "In Object oriented design, combining the services offered by an object with the attributes they work on, results in lower coupling and stronger cohesion."

Select the correct option

- b and d
- a only — Correct
- b and c
- a and c

Explanation :

The goal of object-oriented design is to design classes, objects and their relationships such that the system is both modular and maintainable. Combining the services offered by an object with the attributes they work on can result in lower coupling and stronger cohesion, where coupling refers to the degree of interdependence between modules and cohesion refers to the degree to which elements of a module belong together. Lower coupling leads to greater maintainability, as changes to one module are less likely to affect other modules, while stronger cohesion results in greater modularity and readability, as each module has a clear, focused responsibility.
