

natural/unnatural sounds, and use of volume, beat, tempo, pitch, and rhythm.

Spatial meaning

Conveyed through design of spaces, using choices of spatial resources including: scale, proximity, boundaries, direction, layout, and organisation of objects in the space. Space extends from design of the page in a book, a page in a graphic novel or comic, a webpage on the screen, framing of shots in moving image, to the design of a room, architecture, streetscapes, and landscapes.

Gestural meaning

Conveyed through choices of body movement; facial expression, eye movements and gaze, demeanour, gait, dance, acting, action sequences. It also includes use of rhythm, speed, stillness and angles, including 'timing, frequency, ceremony and ritual' (Cope and Kalantzis, 2009. p. 362).

Types of multimodal texts

Multimodality does not necessarily mean use of technology, and multimodal texts can be paper-based, live, or digital.

Types of multi-modal

encounters. That is to say, when we come together in a communicative event we perceive ourselves and others in the manner in which we have been socialised. We carry expectations, built up over time through socialisation into our own social groups, about what we can and cannot do as members of our various groups. We hold similar expectations about what others are likely to do and not do as members of their particular groups. The linguistic resources we use to communicate, and our interpretations of those used by others, are shaped by these mutually held perceptions. In short, who we are, who we think others are, and who others think we are, mediate in important ways our individual uses and evaluations of our linguistic actions in any communicative encounter.

Topic-048: Agency, Identity and Language Use

While our social identities and roles are to a great extent shaped by the groups and communities to which we belong, we as individual agents also play a role in shaping them. However, unlike the more traditional 'linguistics applied' view, which views agency as an inherent motivation of individuals, a sociocultural perspective views it as the 'socioculturally mediated capacity to act' (Ahearn, 2001: 112), and thus locates it in the discursive spaces between individual users and the conditions of the moment. In our use of language we represent a particular identity at the same time that we construct it. The degree of individual effort we can exert in shaping our identities, however, is not always equal. Rather, it is 'an aspect of the action' (Altieri, 1994: 4) negotiable in and arising from specific social and cultural circumstances constituting local contexts of action.

From this perspective, individual identity is always in production, an outcome of agentive moves rather than a given. When we enter a communicative event, we do so as individuals with particular constellations of historically laden social identities. While these social identities influence our linguistic actions, they do not determine them. Rather, they predispose us to participate in our activities and perceive the involvement of others in certain ways. At any communicative moment there exists the possibility of taking up a unique stance towards our own identity and those of others, and of using language in unexpected ways towards unexpected goals.

As with the meanings of our linguistic actions, however, how linguistically pliable our identities are depends to a large extent on the historical and sociopolitical forces embodied in them. Thus, while we have some choice in the ways we choose to create ourselves, our every action takes place within a social context, and thus can never be understood apart from it. Therefore individual agency is neither inherent in nor separate from individual action. Rather 'it exists through routinized action that includes the material (and physical) conditions as well as the social actors' experience in using their bodies while moving through a familiar space' (Duranti, 1997: 45).

Giddens's theory of structuration

While current conceptualisations of agency and language use in applied linguistics draw from several sources, one of the more significant is Anthony Giddens's (1984) theory of structuration. According to Giddens, individual agency is a semiotic activity, a social construction, 'something

social structures – is what Giddens refers to as the process of structuration.

While Giddens is not particularly concerned with identity and language use per se, his ideas are useful in that, by locating individual action in the mutually constituted, continual production of our everyday lives – the dialogue (Bakhtin, 1986) between structure and action – Giddens's social theory provides us with a framework for understanding the inextricable link between human agency and social institutions.

Bourdieu's notion of habitus

Also influential to current understandings is the notion of habitus, as popularized by social theorist Pierre Bourdieu. According to Bourdieu (1977, 2000), habitus is a set of bodily dispositions acquired through extended engagement in our everyday activities that dispose us to act in certain ways. We bring them with us to our social experiences, and are inclined to make sense of our experiences, and coordinate our actions with others in particular ways. It is through our lived experiences as individual actors that our habitus is continually being reconstituted. For both Giddens and Bourdieu, individual identity is not a precondition of social action but rather arises from it. Moreover, in the recursive process of identity production, individuals are constituted 'neither free agents nor completely socially determined products' (Ahearn, 2000: 120). How free or constrained we are by our habitus depends on 'the historically and socially situated conditions of its production' (Bourdieu, 1977: 95). The empirical concern is then to identify the actions that individual actors take in their lived experiences that lead, on the one hand, to the reproduction of their larger social worlds and, on the other, to their transformation.

Topic-049: Research on Language Use And Identity

Interactional sociolinguistics

One approach to the study of language use and identity that has had great impact on much research in applied linguistics is interactional sociolinguistics (IS), an approach that, to a large extent, is based on the work of linguistic anthropologist John Gumperz (1981, 1982, 1987b). Al

In short, language and society have strong influence on each other. Both are part and parcel of each other so we cannot strongly oppose the influence of one on another.

Topic-036: Language Diversity and Contact

We live in a multilingual world. Approximately seven thousand spoken languages and innumerable spoken dialects and sign languages are in use around the world, some with millions of speakers and others with only a few. No matter how "big" or "small," each language is capable of expressing infinitely generative concepts and ideas. Linguistic diversity is an inherently enabling condition to its speakers and humankind—a resource to be protected and promoted—as each language is the repository of immense knowledge built over centuries of development and use. Linguistic diversity is unevenly distributed across populations and regions. As noted in Austin 2008 (cited under General Overviews), 96 percent of the world's languages are spoken by just 4 percent of the world's people. Papua New Guinea, for example, has a population of about 6.4 million but is home to more than 830 spoken languages—17 percent of the world's total—making it one of the most linguistically diverse countries on earth. At the same time, 96 percent of the world's people speak at least one of the world's "major" languages—about 275 in all—which constitute 4 percent of all languages spoken. Among the most spoken languages, Chinese Mandarin has more than a billion speakers, English has 760 million, Hindi has 490 million, Spanish has 400 million, and Arabic has 200 million speakers. There are abundant varieties of all of these languages. Even when a language is numerically dominant in its autochthonous region, it may have a subordinate status. This foregrounds a key issue in linguistic diversity in education: the status of a language mirrors the social, economic, and political standing of its speakers. Thus, official policies specifying the medium-of-instruction in schools are not necessarily or even primarily based on linguistic considerations, but are tied to larger power relations. Many children are denied an education in their mother tongue because they are members of socially repressed groups, despite conclusive international research showing the educational benefits of mother tongue schooling. Moreover, through policies that marginalize nondominant tongues and their speakers, and via processes of globalization, nondominant languages are rapidly becoming displaced by dominant ones. A 2003 report by the United Nations, for example (cited under International Reports on Linguistic Diversity), predicts the loss of 95 percent of all languages spoken by century's end. The study of linguistic diversity encompasses all of these processes, including how languages are acquired; language pedagogy; individual and societal impacts of bi/multilingualism; policy and political issues; and language maintenance, revitalization, and loss. Addressing these issues requires multidisciplinary perspectives, and the references here reflect that multidisciplinary.

There are many attempts to understand and map this diversity of languages around the world. The Ethnologue database as one of the most comprehensive projects lists exactly 7,099 individual languages in a comprehensive geographic database that many of the above-mentioned statistics are based upon. An even more detailed account when looking at the real diversity of language provides Glottolog of the Max Planck Institute for the Science of Human History in Germany. Glottolog "aims to provide complete references on the world's languages". It also looks at the

Cross linguistic influence is intended as a more comprehensive term as it considers the interaction between all existing linguistic system(s) during the process of third (or subsequent) language acquisition rather than assuming the L1 as the only potential source of transfer. Studies have shown that an existing second language, even if not acquired completely, can interfere in the performance of the L3.

Types of Linguistic Transfer

- Inter-language Transfer (lexical or morphological)

The interaction of a non- primary language with a third or subsequent one

- Cross Linguistic Influence

All existing linguistic systems play an equally important role in the acquisition process of a target language.

- Transfer in Second Language Acquisition (SLA)

Only the primary language plays a role in the acquisition process of a foreign one.

- Transfer in Target Language Acquisition (TLA)

Transfer in TLA considers all of the previously known languages to play an equally important role when it comes to possible interactions between the target language and the existing one(s). The presence of more linguistic systems in the mind of an L3 learner will not only increase the number of potential interactions that can take place, but also alter the course of these interactions.

Hindi, and English (or another European language), and Hindi speakers would study Hindi, English, and another language. According to Sridhar, the Three Language Formula was “a compromise between the demands of the various pressure groups and has been hailed as a masterly—if imperfect—solution to a complicated problem. It seeks to accommodate the interests of group identity (mother tongues and regional languages), national pride and unity (Hindi), and administrative efficiency and technological progress (English)” (Sridhar, 1989: 22)

Topic-074: Language Planning: Haugen's Model

There are more than one LP models available to researchers. For example, in his discussion of what he calls language development with reference to language planning, Ferguson (1968) comes up with his three-category model: graphization (choice of an alphabetic system, spelling, punctuation, and capitalization), standardization (developing the so-called ‘best’ variety that will be the language of a speech community), and modernization (expansion of the lexis of a chosen variety so that it can keep up with the ever-increasing needs of society). For Cobarrubias (1983), there are four ideologies which can have great impact on decision-making in language planning in a particular society: linguistic assimilation (everyone in
