DEFINING SPEAKING

Speaking: An Overview

Language is a means of thinking and transferring culture from one ge as from one nation to another. It is also a means of communication among peo emphasize teaching languages other than the native language to its citizens. O English has become the most important foreign language in the world. At prese for international communication.

Speaking is one of the four language skills (reading, writing, listenin means through which learners can communicate with others to achieve certai opinions, intentions, hopes and viewpoints. In addition, people who know a l 'speakers' of that language. Furthermore, in almost any setting, speaking is language skill. As Rivers (1981) argues, speaking is used twice as much as r communication.

Speaking has been classified to monologue and dialogue. The form interrupted oral presentation and the latter on interacting with other speakers. Sp of two main functions: transactional (transfer of information) and interaction relationships). Developing speaking skills is of vital importance in EFL/ESL pro Burkart & Sheppard (2004) argue that success in learning a language is measure carry out a conversation in the (target) language

Speaking is more than to form grammatically correct sentences; it rat mechanics, functions, pragmatics and social interaction. Speaking is a comple cognitive process. Speaking is a high complex mental activity which differs fro it requires much greater effort of the central nervous system (Bygate, 1998: 23). and involves distinct areas of planning. First the speaker has to retrieve words a and assembles them into syntactically and propositionally appropriate sequence Speaking also happens in the context of limited processing capacities due t nemory.

Characteristics of Spoken Language

Languages originated from the need for communication between and eed spoken language appeared and developed. The purpose and the function bout other people and let others know about you. Language is a tool of c ociety. This kind of communication is a bi-directional process which includes b s well as giving out information. This giving-out includes speaking and writing.

All languages have some characteristics in common which are as followi

- Interruptions and overlapping are nor…
- Frequently displays ellipsis.
- Speech makes use of many formulaic expressions.
- Negotiation of topic is also very important: yes but«, anyway«, right then«,
- Interlocutors give and receive immediate feedback.
- It has many routines and this can make it very predictable. For example you never say, 'Give m… a banana' in a bread shop. But, each situation has its own discourse which has been historicall… and socially defined.

THE SKILL OF SPEAKING:

Speaking is an interactive process of constructing meaning that involves producing, receiving and processing information. Its form and meaning are dependent on the context in which it occurs, including the participants themselves, the physical environment, and the purposes for speaking. It is often spontaneous, open-ended, and evolving. It is the process of building and sharing meaning through the use of verbal and non-verbal symbols, in a variety of contexts" (Chaney, 1998,) Speaking is an interactive process of constructing meaning that involves producing and receiving and processing information

One of the central difficulties inherent in the study of speaking is that it overlaps with a… disciplines. How far, for instance, is the structure of a…

A second, related, factor underpinning the nature of speech, and affecting the voices that can be made, is its delivery via the oral/aural channel. Channel is a term u physical means by which communication takes place. In terms of speaking there is the d in terms of writing the visual/motoric channel. Discourse can be studied in term annel on the language. These include the constraints of speech processing in rea pacity to reflect and edit that the written channel allows.

One of the commonest problems in oral presentations is information overload f to process densely informative language that has been prepared via a written te ects of the way speech is produced again relate to the transient and situated nat nnel. The vast bulk of spoken material is spontaneous, face-to-face, informal conve liscourse is generally unplanned, dynamic and context dependent. A conversation speaker or another who wishes to deal with a particular topic; however, the vag texts mean that most speech takes the form of a give and take, not only between veen the discourse and the context.

r speech is regarded

The spoken form is very highly valued in linguistics and applied linguistics wh e primary form of a language and the source of innovation and language change nd language teaching there is also a high degree of attention paid to the skill of spe fluent speaker in a language is often the lay person's goal. The source of input in municative approaches' is largely the spoken form, and there has been a conflatio rm 'language' with 'speech' as if the two are entirely interchangeable.

The innate, universal human capacity for speech has led to its being regarded a erest to linguists. Therefore, even when theorists appear to pay no attention to a h, fundamentally they are pursuing questions related to the primary language facul niversal linguistic form: speech.The spoken form is the basis for investigations sition. Since no child learns to write before he or she learns to speak, the spoken available for consideration and, therefore, in first language acquisition stud guishing 'language' from 'speech' is irrelevant.

Speech is also quintessentially the form in which the inter-personal functions l out and the form is subject to the benefits and disadvantages that stem from the v ore, whereas the tangible, no ephemeral nature of writing lends it to logical ns in society, for example record keeping and legal tasks, the spoken form, being lent on the time and place it is produced, is used for more informal or rhetorically

Does Speech Fit in Language Studies?

There is the paradigm set out by Noam Chomsky in the 1960s and which in turn ater part of second language acquisition studies, advances in grammatical mode ing in which a linguistic element is required. A central aspect to the discussion my between the language faculty ('competence') and the way language is used in ('performance'). Essentially, this division stemmed from Chomsky's questioning

©Copyright Virtual University of Pakistan

CamScanner

using all the benefits of being physical[illegible] and so on. On the other, unless captured and recorded in some[illegible] transient in nature and cannot be checked or scrutinized after the event.

The art of speaking has been connected to the skill of persuasion, and the ability to influence others by means of rhetoric. The beginning and end of the nineteenth century show a marked change in the status of speech in the language teaching process. This was brought about in the transition from 'grammar translation' methods which dominated language teaching in the early parts of the century in Europe to what came to be termed the 'Reform Movement' which arose around the 1880s.

The 1960s with the influence of the work of Noam Chomsky, and the 1970s and 1980s with the growth of 'communicative' approaches, marked two distinct sea changes in the field of language teaching both of which did much to underpin present attitudes to the spoken form. While these two threads are brought into commonality by research in the field of second language acquisition, they have marked differences in the emphasis they placed on speech in their thinking. On the one hand, the transformational grammar movement internalized and made abstract the language system to such an extent that actual speech became something of an irrelevance. On the other, the tenets of the communicative movement held that language was acquired by meaningful and interesting communication in contexts which mimicked real communicative settings as closely as possible.

f Pronunciation

good pronunciation of the language can help in normal communication, particu
wing and Munro, 2005). However, that is not the only reason for developing a s
new language. There is a very important mechanism involved in working me
gical loop. In essence, the phonological loop is the brain saying a word or phrase
in order to keep it in working memory or to help it move into long-term memo
his is the way we say a telephone number over and over to ourselves in order to k
we go about dialing the number. If learners do not have a stable pronunciation
sily enter long-term memory because it cannot be held in the phonological loop.

d language learners it is likely that the size of their working memory in the
ed by their knowledge of patterns of pronunciation and grammar in that languag
t attention is given to pronunciation in the course so that learners can quickly de
ion, and become familiar with the patterns and rules that work within the

nunciation Instruction

deal with language-focused ways of trying to develop pronunciation. It is viev
affected by a wide variety of factors. Being able to consciously perceive and pro
nly one of these. Some teachers reject any type of form-focused pronunciation t
bly short-sighted. Appropriate attention to form for pronunciation is likely to
ood effects as attention to form can have for the learning of vocabulary, gra
th all instruction, it is necessary to find a suitable balance between the four s
learning.

iation includes the articulation of individual sounds and the distinctive features
aspiration, voice-setting features (Esling and Wong, 1983), and stress and i
e aspects also requires attention to the blending and omission of sounds, and th
ects on intelligibility. Thus, although it can be very useful to provide pra
ls, it is also important to give attention to other aspects of the sound system.

; to change the fossilized pronunciation of advanced ESL learners, Acton (198

Goals

There continues to be debate
native-speaker or non-native-speaker English,
American or some other regional pronunciation. Once po
approach is to set up a list of criteria that typify a good pronunciation (Bro
include intelligibility (Abbott, 1986) (to both native speakers and non-native sp
pronunciation identify the speaker with others he or she would like to be i
learning, acceptability by parents and the educational administration, and the av
materials to support the wanted pronunciation. In reality, this most often means
of English become the norm for the majority of learners.'

Stevick (1978) considers pronunciation and personal identity to be very
teacher that ignores this could spend a lot of wasted effort on an unattainable goal.
the nativeness principle which sets a native-speaker goal for learners, and the
which accepts accents and sets understanding as the goal.

Jenkins (2002) argues that intelligibility must be the main criterion and d
he Lingua Franca Core" which consists of the phonological and phonetic feat
ucial as safeguards of mutual intelligibility" in interlanguage talk. These include
nds with some provisos, initial consonant clusters, the distinction between long
placement of contrastive stress. Jenkins' proposal is a very pragmatic
unciation goals.

rs Affecting the Learning of Another Sound System

There are five factors that have been shown to have major effects on the
system. Following are the factors:

the age of the learner
the learner's first language
he learner's current stage of proficiency development
e experience and attitudes of the learner
e conditions for teaching and learning.
actors need to be considered in a well-balanced approach to pronunciation.

e is clear evidence that there is a relationship between the age at which a lan
e of foreign accent (Patkowski, 1990). Usually, if the learner began to spe
re the age of six there will be little or no accent. If the learner began to sp
and 11, the learner is likely to have a slight accent. If the learner began to
there is almost always an accent (Tahta, Wood and Lowenthal, 1981a and

are two important points to note here. First, this relationship between age a
apply to everyone. A few adult learners do achieve native-like pronunciati
competing explanations of the cause of the relationship.

The physical explanation says that there are physical changes in th
affect the learning of a new sound system and other aspects of the language.
says that learners have already learned the sound system of their first la
disrupts their perception of a second and later language. Age affects this
language system becomes increasingly well-integrated and stable as learners
psychological explanation says that pronunciation is a part of our persona
we become more protective of our personality and unwilling to change it.

The intellectual and psychological explanations are not in conflict w
it means that these factors have to be considered when designing a lesson
(1978) combines these two explanations. Stevick believes that learners a
sounds, but there are three reasons why they might have difficulty.

- **They overlook some feature.** If this happens the teacher can help
  which is not too difficult for the level the learners have reached an
  learners to find out how near their pronunciation is to the standa
  addresses the intellectual aspect.
- **The learners sound bad to themselves when they copy well.** Peopl
  their pronunciation because it allows others to guess their social ba
  pronunciation of a foreign language is very good, others may think
  foreign culture and want to be like the foreigners. Learners' pronu
  they feel more comfortable about the way they sound when they spea
  when they develop positive attitudes towards the native speakers of th
- **The learners become anxious about making the sounds.** If the
  students that they are not saying something correctly, they may beco
  and be unable to do it correctly. The teacher thus needs to find ways
  what their pronunciation is like without getting them worried about it.

Stevick's approach sees the learning of pronunciation as only one
mainly social in nature, which involves the whole learner and not just the spee
understanding.

The Learner's First Language

The learners' first language can have a major influence on learning th
anguage. The type of evidence for this is where speakers of the same first lan
e second language in the same way, making the same kinds of subs
onunciation.

Another type of evidence is that there is a reasonable degree of pre
ationships between first language and second language sounds and their r

learners experiment with sounds. By changing the position of their tongue th
changing the position of the lips and teeth the sound can be changed. Activ
learners to be able to feel where their tongue is in their mouth. This is a u
new language.

Teaching the sound usually begins with hearing practice because it
also improves pronunciation (Henning, 1966). A good technique for pract
learners to understand, tells the teacher quickly and easily if the learners c
gives most of the class some practice.

Hearing Sounds

To help learners in **distinguishing sounds**, the teacher says a pair o
vords). Sometimes the two words are the same, *pa—pa*. Sometimes they h
a. The learners listen and if they think that the two sounds are the same, th
ifferent, they say "different". Learners answer individually when the t
arners can move their right hands when the two sounds are the same a
ifferent. Briere (1967) found that learners preferred to answer "the same'
ey were not sure of the correct answer. Thus, in such exercises many of
lifferent"

In the **identifying sounds** activity, the teacher writes two words c
nd next to one of the words.

(picture of a hand)

Whenever the teacher says a word which begins with the same sou
the hand next to it, all the learners must move their right hand. If the tea
h the other sound (the one which does not have the picture of a hand ne
is gives all the class practice and the teacher can easily see who can h
rcise the learners can shut their eyes so they do not copy the others
ring. One of the most important parts of hearing practice is telling the l
ot. The teacher should give plenty of examples first and move her h
the learners. The learners should practice hearing the sound in all pos

In **identifying sounds using pictures**, the learners see two pictu
ep and another showing a ship. When the teacher says "a sheep" the l
ure. This exercise is used with pairs of words that are the same exc
mple, *watching—washing, chair—share, live—leave*, etc. In order to
teacher should put the two pictures far apart at opposite ends of the b
ly see who is pointing to the wrong picture. The pairs of words can be

CamScanner

teacher guiding
There is no rule that hearing pra
way is best for certain learners and certain sou

Producing Sounds

In the **repeating sounds** activity, the teacher says the new or difficult sounds. The learners listen and repeat. Locke (1970) found that after a learner had copied a model to pronounce a new sound twice, there was very little further improvement. That is, after repeating the sound for the second time the learners did not usually make any more improvement even though they heard the same model and tried to copy it several times Once the learners can make the sounds well the teacher can give a written model or show pictures or objects to get the learners to pronounce the sounds.

Difficult vowel sounds can often be made by using the exercises that Pike (1947) calls **slurring and bracketing**. In slurring, the tongue or another part of the mouth is slowly moved from one position to another. This is done several times with the learners copying the teacher. Then the movement is stopped a part of the way between the two sounds so that the wanted sound is produced.

In **testing the teacher**, some of the exercises that are used for hearing practice can be used to practice pronunciation. The learners take the teacher's place, and the teacher takes the learner's place. So, for the same different exercise the learners individually pronounce pairs of words and the teacher says "the same" or "different".

Sometimes, **using the written forms** can help with new clusters. Learners can look at the structure of the syllable as a help for word recognition and vocabulary learning. The patterns for final consonant groups are much more complicated than the consonant groups at the beginning of the words. ise to get learners to find the main patterns at the beginning of words. This between spelling and pronunciation.

CamScanner

orrecting Pronunciation Mistakes

When a learner makes a pronunciation mistake and the teacher wants to corr acher can do any of the following things.

- The teacher repeats the word correctly several times with ordinary stress and learner self-corrects by copying the teacher.
- The teacher repeats the word correctly giving extra stress and length to the pa made the mistake. The teacher compares the mistake and the correct form: "N
- The teacher writes the word on the blackboard correctly and underlines the pa made a mistake. The teacher also says the word correctly.
- The teacher just says "No" and lets the learner find the mistake without h make a certain signal, like hitting the desk softly, when a learner makes a pr This technique is used when the learners can make the correct sounds but talking.

tress and Intonation

Languages can be classified according to whether they are stress-timed or s be thought that in a stress-timed language (like English) the stresses were equa hough the number of syllables between each stress was not the same. This w yllables would have to be said very quickly if there were several between two str e said slowly if there were few between two stresses. In syllable-timed languages egular intervals (as in Spanish and Indonesian). Research indicates that the spaci neans equal in stress-timed languages although there is a tendency towards regula nain differences between stress-timed and syllable-timed languages lie in syll ength varies more in stress-timed languages than in syllable-timed languages), imed languages are more likely to use centralized vowels in unstressed syllab shortened or omitted), and lexical stress (stress-timed languages usually have wor

Teaching Word Stress

In English, one part of a word is usually said with greater strength, Strong stress often goes with an increase in the length of the syllable and a chang no easy rules to find which syllable should be stressed in a word. The stress pat to be learned. A common mistake is to say words with the stress in the wrong p in the following ways.

- The teacher taps the stress pattern of a word, with a hard tap for the str the others. The learners say the word.
- When the teacher provides a model she can make the stressed syllabl unstressed ones very short.
- When the learners say a word, they make a gesture to go with the str gesture can be a hand movement.

Negotiation

The integration of listening and speaking emphasizes active liste
and shaping the spoken message. Part of the skill of listening is learni
providing feedback to the speaker (Brown, 1986). This feedback may inv
the comprehensibility of the message and specifying where the pr
questioning is called **negotiation.**

One of the main ways that negotiation helps the listener learn i
Negotiation also plays other roles in assisting language development, s
based on Long's detailed discussion of interaction (Long, 1996: 445–454)

- makes input understandable without simplifying it, so that l
  retained
- breaks the input into smaller digestible pieces
- raises awareness of formal features of the input
- gives learners opportunities for direct learning of new forms
- provides a "scaffold" within which learners can produce increasing
- pushes learners to express themselves more clearly and precisely—
- makes learners more sensitive to their need to be comprehensible

Overall, interaction helps language learning by providing opportun
through negotiation, and by speakers having to adjust their output to c
interaction helps learning by providing plenty of comprehensible input, by
making learners aware of what they do not know, and by helping learn
strategies needed for interaction.

Encouraging Negotiation

The extent to which negotiation helps language learning depends o
far the negotiation takes the learner through comprehending, noticing, comp
partly unfamiliar language items.

Several studies of negotiation have shown the range of reasons f
Larsen-Freeman and Long, 1991). These include keeping the group togethe
clarifying poorly presented items, clarifying because of inattention, cla
clarifying the task procedure. Only a few of these are likely to contribute
When the teacher monitors tasks involving negotiation to judge their effe
look carefully for negotiation of lexical and grammatical items and sho

group's advice with that provided by the newspaper, will provide a useful repetition of the items.

There are many techniques which provide written input which could encourage negotiation. These include **completion activities, ordering activities, split information activities, ranking, problem solving,** and **modify the statements.**

It is the nature of the task that determines the kind of language use that occurs. It is the learners who determine what kind of interaction occurs with a given task (see also Nakahama, Tyler and van Lier, 2001). In addition, strongly focused two-way tasks can result in the use of almost telegraphic language because this is the most efficient way of getting the message across, particularly when there is a time limit placed on the task. Similarly, the way in which the learners take turns in a task is largely determined by the nature of the task. Teachers need to monitor tasks well and use this feedback to redesign tasks to suit learning goals.

©Copyright Virtual University of Pakistan

Using Information Distribution to Encourage Negotiation

It is possible to distinguish four kinds of group work according to the wa in the activity is distributed among the learners (Nation, 1989b). These four ways

- All learners have the same information (a cooperating arrangement).
- Each learner has different essential information (a split information arrang
- One learner has all the information that the others need (a superior inferior
- The learners all see the same information but each one has a different task.

The term "information gap activities" is sometimes used in the literature. nformation tasks and superior-inferior tasks. The first two types of information di at most encourage negotiation, and there has been considerable research int formation activities have been called two-way tasks, or jigsaw tasks, and cooper lled one-way tasks.

The essential feature of the split information arrangement is that only by nbining their material can the learners find the required answers. A learner car ply by looking at their own material.

Split information tasks can be used with learners at any level, from beg nts, if appropriate materials are employed (Nation, 1977). One weakness of the re labelling and completion of diagrams with words is that learners can resort to h other and in so doing reduce the quality of meaning-focused talk.**Cooperatin** rners having the same information. For example, in a **ranking** task, the learners nd a criterion for ranking or choosing amongst the items. They must arrange the erion or choose the top 3 and the bottom 1.

This type of **problem-solving** activity can be done by moving through a varie e learners are presented with the problem and are then asked to think indiv and choose a possible solution. In the second step, the learners work in small g nt. The third step involves whole-class work in which groups compare their acilitates discussion of the rankings and of language issues that came up in th ng with a strong focus on reaching consensus can encourage negotiation of la to reach agreement, then there must be understanding. Here are some techniqu

modify the statements; the learners are given a set of controversial statement nake changes to the statements so that everybody in the group can agree wi ind of **problem solving**, the learners are given a problem to solve. They n agreement amongst themselves. They should not do this by voting but by e in small groups of about six people. When they have reached an agreement r discussion to the class. LEARNING THROUGH TASK-FOCUSED INTERACTI

Using Learner Training to Encourage Negotiation

In order to negotiate, learners need to know the language features needed for n
velop negotiation strategies. Anderson and Lynch (1988) have reviewed studies w
akers on the effect of training on the use of negotiation while listening. The training ca
ners the importance of asking for more information, watching others ask, and provid
hat to do when there is a comprehension problem.

Encouraging second language learners to negotiate can involve learning the appro
and procedures to negotiate and providing opportunities for practice. When ta
rsation, a learner may find that there are unknown words or structures, or that what t
ot clear. If this happens, one strategy is to ask for clarification.

Clennell (1999) describes a useful procedure for making learners aware of the
nguistic features of interactive spoken language.

Stage 1 involves preparing for an interview and then carrying out the interview. Th
an involve focusing on appropriate ways of addressing the interviewee, diffe
equesting an interview, and so on. It can also involve ways of managing the discou
e interviewee to repeat or slow down.
age 2 involves transcribing the recorded interview and coming to an understan
opened during the interview.
ge 3 involves presenting the analyzed transcription to the class in the form o
entation with accompanying discussion. Lynch (2001) found plenty of ev
scribing their own spoken interaction resulted in learners finding plenty to improv
to make substantial corrections to the language of the transcription. There was a
w-up role for the teacher in providing helpful corrective feedback especially in
e. The teacher's feedback on learners' written transcription of a taped reh
tation had substantial positive effects on the grammatical accuracy of a
tation.

and do activities can also give rise to negotiation if they are at the right level of

In **discover the story** one learner has a copy of a story. They tell the to
group and they ask questions to discover what the story is about. There
hnique. All of these activities increase the need for negotiation between th
involve an information gap which may be there because of split inform
formation distribution.

lonitoring Negotiation

Group work can have a variety of learning goals and monitoring sh
goal is the learning of language items, then the amount of support that learn
the activity will be of major interest. This support can take the form o
language items, the encouragement of turn-taking to involve all of the grou
contributions by commenting positively on or picking up others' ideas, ar
of needed items.

Teachers or learners acting as observers can look for these kinds
to the group as a way of bringing about the development of group suppo
learning. If observation shows that there is a need for increased sup
arranging this, which are as following;

©Copyright Virtual University of Pakista

CamScanner

context which is not overtly signaled, and by the non-negotiated noticing of language features (Newton, 1995; Nation, 2001: 123–125). Sometimes there may be overt signs of this noticing.

Small group activities provide an opportunity for the productive use of items supported by the interaction with colleagues. It is likely that the design features to encourage this production include the use of information gap tasks which contain a large amount of shared information.

The **find the differences** activity is a good example of this. In this activity a pair of learners have a similar picture each, but they have to find the differences by describing and not showing their pictures to each other. In this activity the support comes from the common features of the two pictures. Support may also involve some kind of support during the task such as notes, pictures with annotations, or objects.

In this procedure the teacher may simply rely on group cooperation to produce the wanted vocabulary and constructions. If monitoring the activity shows that this does not happen, then it may be necessary for the teacher to write words and phrases on the pictures for the learners to use. This gives the first activity something of a focus on form, and so the follow-up activities of turning it into a dialogue and then acting it may serve to bring back the meaning focus. All these kinds of support allow learners to draw on explicit knowledge of the language in their spoken production.

Monitoring Learners Beginning to Speak

Some learners may be reluctant to speak. It is important to find
with the causes. The following table outli

Each of the possible causes for reluctance to speak is accompanied by a way of checking the cause. A vocabulary of 1000 words is easily enough for substantial spoken production. It is important to be aware that reluctance to speak may not be only because of language difficulties. It is observed that some learners possessed adequate language skills, but had not received enough encouragement to speak in a classroom. When they were taken out of the classroom for short periods of time with one or two other learners and given lots of encouragement to speak, they were soon speaking a lot. After several sessions of such speaking, they seemed more willing to contribute to speaking in the larger class.

Observing learners in speaking activities can provide important information for the teacher about the learners' control of developmental features, like question making, and other features. This information can indicate to the teacher where language-focused instruction could usefully be directed. The presence of a feature in the learners' speaking is a sign that formal teaching could have a positive effect on expanding and refining its use.

CamScanner

comprehension. Given, [illegible] (1995) argue that because language [illegible] their attention to one demanding task at a time, they initially learn vocabulary. Once vocabulary recognition is largely automated, they can then give their attention to grammar. Swain suggests that if learners are not pushed to produce output, then there is little reason for them to pay attention to the grammar needed for production. Pushed output can result in the learner moving "from a purely semantic analysis of the language to a syntactic analysis of it" (1985: 252). This analysis could result in the learning of new grammar.

Pushed output does not mean that learners have to be pushed to produce as soon as an item is introduced. There is value in building up receptive experience, but this needs to be seen as only a first step. Learners need to be pushed to turn their receptive knowledge into productive use.

©Copyright Virtual University of Pakistan

CamScanner

Pushing Output

When planning for a variety of speaking tasks to push learners' output there ar consider. These include

- covering a range of topics
- a range of text types
- a range of performance conditions

Topic

Learners should be pushed to speak on a range of topics. Van Ek and Alexande categorization of topics. West (1960: 113–134), in his classification of the M Vocabulary, also provides a range of possible topic areas. Topic is most likely to ha vocabulary that is used as each topic is likely to have its particular technical, topic- Covering a good range of topics in a course ensures that a wide range of vocabulary also have a relationship with amount of background knowledge, as learners may b content of some topics and not with others. There could be strong gender difference background knowledge of topics which can make some topics much more demand male and female learners.

Text Type

Biber (1989) distinguished eight major spoken and written text types on the basis largely grammatical features. These text types included intimate interpersonal inte exposition, imaginative narrative and involved persuasion. Although most of these many of them do have spoken equivalents. The most useful distinctions to consider learners are pushed to cope with a range of text types are:

- Involved interaction versus monologue. Is an only one person speaking or ar with each other?
- Colloquial speech versus formal speech.
- Short turns versus long turns. Do speakers make short contributions to a cor opportunity for longer largely uninterrupted speech?
- Interactional versus transactional speech. Is the goal of the speaking to relationship or is it to convey important information (Brown, 1981)?
- Narrative versus non-narrative.

Learners should have the opportunity to speak across the range of these types of spea

Performance Conditions

When learners perform speaking tasks they can do this under a variety of co has received a reasonable amount of attention in research is the opportunity for plann

Planning

©Copyright Virtual University of Pakistan

CamScanner

Planning involves preparing for a task before the task is performed. Typical time to think about a given topic, having time to prepare what to say, and taking brie say.

Planning helps language production because it allows part of the work to be so that there are less things to attend to while the task is being performed. In researc found that about ten minutes' planning time is usually enough to give good re planning are usually measured by looking at the effects on fluency, grammati grammatical accuracy. In several studies, planning had positive effects on fluer complexity, but had mixed effects on accuracy.

Getting learners to use new language items while their attention is focused they are conveying is a challenging part of activity design. One of the most effec receptive language knowledge into productive use is to make use of techniques whic

Giving learners a chance to prepare for tasks can increase their chan preparation could involve the **retelling** of a previously studied written text, grou preparation and rehearsal before the task, or research and planning on an ass **judgement**, preparation is an essential part of the task. Two learners are chosen to quiz. They are given a text to read which they will later be quizzed on. The rest o text and the questions which the competitors will be asked. The competitors do Then the competitors are asked the questions orally and the rest of the class note answers are right or wrong.

In an **ask and answer** activity (Simcock, 1993), the learners work in pairs. to study and the other has a set of questions based on the text. The learners may wo Then one learner questions the other to get them to display their knowledge of the for a few times and eventually do it in front of the class. The performance is done text. Many variations of this technique are possible, particularly in the relationship text and the type of processing required to answer them.

Time Pressure

The second major performance condition affecting speaking is ti researchers have distinguished on-line planning and pre-talk planning (Yuan ar planning involves paying careful attention to turning ideas into speech while they likely to have a positive effect on accuracy. On-line planning is helped by having Pre-task planning, as in **prepared talks**, is more likely to allow learners to focus cover and the organization of these ideas. Giving learners plenty of time to p allows them to access both their implicit and explicit grammatical knowledg quality of their spoken output.

Amount of Support

©Copyright Virtual University of Pakistan

CamScanner

speaking with others can be supportive, it can also be demanding. ...is also a

Informal Speaking

Informal speaking typically involves tasks where conveying information is not as important as maintaining friendly relationships. Brown (1978) calls this interactional speaking as opposed to transactional speaking. Interactional speaking can be supported in the following ways. This support enables learners to produce what they would not normally be able to produce.

- Learners can be taught conversational strategies that can help keep the conversation going (Holmes and Brown, 1976). A very useful technique for doing that is called **Q–>SA+EI**. What this formula means is a question (Q) should be followed by a short answer (SA) and then some extra information about the answer (EI). So if someone asks "How long have you been here?" the reply may be "About six months, but I found it very difficult at first". This extra information then provides an opportunity for the person asking the question to continue the conversation, typically by taking up the point raised in the extra information, "What were the difficulties you had?" This very useful strategy deserves quite a lot of practice in class, particularly in guiding learners in the kinds of extra information that they can provide. It is also a good way for the person being questioned to take control of an interview or conversation by using the extra information to guide the direction of the conversation (Nation, 1980).
- Having a supportive partner in ...

...also provides an excellent opportunity for learners to become aware of what is involved in speaking effectively and can lead to the development of useful planning and delivery strategies.

...such as, I see, That's right, Are you sure?

Formal Speaking

Formal speaking helps language learning in the following ways. It represents a new use of English for most learners and thus requires them to focus on language items that are not as well represented in other uses of the language (Biber, 1989). Formal speaking requires control of content, awareness of a largely passive audience, and being the focus of attention (a rather unsettling experience). It thus requires learners to use language under difficult and demanding circumstances, which will stretch the boundaries of skill development.

In a study of first language speakers of English, Brown, Anderson, Shillcock and Yule (1984) identified the following ways of getting learners to develop their skill in taking a long turn.

- Learners should experience the task from the listeners' point of view. This enables them to notice ...should avoid in their own spoken presentation, and helps develop a sense of

LEARNING THROUGH PUSHED

The Nature of Formal Speaking

Speaking as a part of work or academic study may involv
viewpoint on a particular topic. This type of speaking has seve
following:

- It is transactional. Its purpose is to communicate inform
  contact as is the case with most interactional speaking.
- It involves taking a long turn. That is, it is not usually l
  speaking for several minutes in a comprehensible and organi
- It is influenced by written language. Often it will involve s
  academic vocabulary.
- The speaking is done in the learner's "careful" style i
  opportunity for the speaker to monitor the production.
- It often needs teaching as it is a skill that is not a part of typi

These features have implications for teaching.

Teaching Formal Speaking

The transactional nature of formal speaking means that
performance should focus on the successful communication

It is useful for members of a language class to present tasks to each other both the roles of speaker and listener. It is also useful to take part in tasks wh evidence about whether the speaker understands or not. This can be done with e type tasks, or with a restatement type of activity like **triads.**

A speaker may have difficulty with a talk because there is little to talk abo understood. A high level of familiarity with the content of a talk is likely to l aspects such as the presentation, formal correctness and awareness of audience. So talk can involve using group work activities to gather and elaborate the informatio **Brainstorming** is an effective way of doing this. In this activity learners sugges uncritically, the main goal being to get as many ideas as possible. Later the i evaluated. An advantage of brainstorming is that it can result in a very diverse coll more focused way of gathering ideas involves using information schema or se gather information systematically

Organizing ideas clearly relates closely to awareness of the audience and in preparing a talk there could be continual movement between these parts of t begin the talk with a complete overview, or is it most suitable to begin with an e be divided into quite separate sections? In making such decisions it is useful to organized their talks or rhetorical models such as description by exemplificati elimination of alternatives.

Most people speak using written notes as a guide. These probably offer much as they offer guidance. Learners should practice being able to prepare and For any particular talk this may mean starting from quite elaborate notes and with Even very experienced speakers welcome the opportunity to practice their audience.

The **pyramid procedure** involves a changing audience which can p repetition with the speaker using an increasingly reduced form of notes each tim grids and diagrams are a useful form of notes to guide speaking. Due to their str the speaker a systematic route to follow and allow the audience to predict what w

Presenting and monitoring the talk, like all the other parts of the formal planned for and practiced. Repeated opportunity to present is important here. Ta checklists are also useful. Feedback on presentation should lead learners to rec formal speaking process.

Guidelines for Presenting a Formal Talk

The following guidelines for presenting a formal talk take accou monitoring the attention of the audience, and communicating a clear message.

- The message should be limited to three or four important pieces of infor

LANGUAGE-FOCUSED LEARNING: DELIBERATE TH

Introduction

Language-focused learning involves giving attention to features of the la particular message that they convey, but for their spoken or written form, their patterns that they fit into, or their correct use. Surprisingly, the boundary betw learning and meaning-focused instruction is not so easy to draw. Noticing an item acquisition. This noticing is arguably attention to language; that is, the temporary the item so that it is viewed as part of the language system rather than part of the focused learning, the attention to the item as part of the system is likely to be tea explanation or through the design of an activity).

The Value and Limits of Language-focused Learning

Language-focused learning can help second language learning. Languag ave the following effects:

- A combination of language-focused learning and meaning-focused use lea either kind of learning alone.
- Language-focused learning can speed up the rate of second language acqui
- Language-focused learning may help learners to continue to improve th rather than becoming stuck with certain errors.
- Some language-focused learning can lead directly to acquisition, dependir focused on, especially vocabulary (Elgort, 2007).
- Language-focused learning can indirectly provide meaning-focused

There are, however, limitations on the effect of language-focused lear lude the following:

- Language-focused learning cannot change the order in which learners a developmental features of the language, such as questions, negatives, and
- Language-focused learning needs to be combined with the opportunity t meaning-focused use.
- Some grammatical items learned through language-focused learning may learner in planned use.

The most important finding is that language-focused learning has an i id language acquisition. The purpose of this chapter is to show what this rc tively played.

erate Vocabulary Learning

The best language-focused vocabulary instruction involves looking at a than as part of a message. This means paying attention to regular spellir

parts and other mnemonic procedures for learning new low frequen
ısibility for using these strategies to increase their knowledge of low

cabulary instruction should involve thoughtful processing so that t
ıould evaluate the procedures they use and the procedures their
s. One way of doing this is to look at them from a "levels of process
he learners have to be when they use a particular procedure. Evalua
v can involve asking questions.

abulary instruction should avoid grouping words that will interfere
and meaning relationships between words shows that near s
nd members of a lexical set such as names of fruit or items of cl
ke learning more difficult if they are learned together. This means t
r a learner, and if they are learned at the same time, the learn
h is which and not mixing them up. Unfortunately most course d
and deliberately group words in this way.

bulary instruction should take account of the flexibility and crea
by drawing attention to the systematic features of vocabulary

CamScanner

Knowledge gained through deliberate learning should be enriched by o through meaning-focused input and meaning-focused output. Language-focused lear end and that end is not reached unless learners can easily find the words they need the language. It is therefore important to make sure that the words that are lea opportunity to be used, and to be used fluently.

Techniques and Procedures for Vocabulary Learning

The following description of techniques and procedures has been a proficiency level—beginner, intermediate, and advanced.

Beginners

There are numerous possibilities for conveying the meaning of new voca teaching before meeting the words in context and explanation in the context of list substantial effect on learning compared to incidental learning without directly f means that before listening activities, it is worth drawing learners' attention to s that will occur and that it is worth learning. This can be done by listing words on discussing them, giving learners lists of words and meanings to work on at home, mapping activity drawing on the learners' previous knowledge and introducing the the map.

For adult beginners, it is useful to have a rapid expansion of vocabulary th learning. An effective way of doing this for older learners is to make use of vocal small cards (about 4cm × 3cm) with the second language word on one side translation on the other. Particularly at the beginning level, it is useful to have a ph word along with the word. Learners use these cards in their own time, looking a short time. It is good to change the order of the cards as they are looked at to learning. The use of such cards should be combined with mnemonic technique **technique**, or **word part analysis**, or simply creating a mental picture of the wo is used. The considerable amount of research on this rote learning proce effectiveness.

Even at an early stage of language learning, it is worth looking at wo inflectional suffixes of English are a good start as they are all frequently use context strategy is so useful, it is worth practicing it as early as possible. At context clues will come from the situational context rather than the linguistic guessing procedure will add some depth of processing to the learning of new wo

At this level, direct teaching of vocabulary is useful. The techniques us first language definitions, synonyms, pictures, or demonstration. Some iten greetings and polite phrases should be practiced to a high level of fluency. mnemonics for the words, but this should be regarded more as training in getti own mnemonics because research indicates that mnemonic tricks created by ea retention than those provided by others.

take part in meaning-focused experience tasks. If the items that
available for fluent use, then the learning has been for little purpose.

Designing Fluency Activities

Fluency activities depend on several design requirements and
can appear in a variety of techniques over the whole range of la
requirements and features we can judge whether an activity will deve
we can devise other activities that will. Let us look first at a well-resea
was devised by Maurice (1983). In this technique, learners work in
and the other as listener. The speaker talks for four minutes on a topic
pairs change with each speaker giving the same information to a nev
by a further change and a two-minute talk.

From the point of view of fluency, this activity has imp
encouraged to process a large quantity of language. In 4/3/2 this i
perform without interruption and by having the speaker make three
demands of the activity are limited to a much smaller set than would
activities. This can be achieved through the teacher's control, as is
activities such as reading graded readers or listening to stories, or it

©Copyright Virtual University of Pakis

CamScanner

onsciously controlling the level of the input. However, it can also be achieved by using learner control. his is done for listening activities by getting learners to provide input for other learners, such as when earners present short talks to the class. In speaking activities, allowing learners to provide their own opics and to speak based on their own writing, for example, provides learner control which makes the ctivity an experience task and thus suitable for the development of fluency.

Message Focus

Having a clear outcome to an activity encourages a meaning focus because the learners use anguage to achieve the outcome. Commonly used outcomes in spoken activities include completion; listinguishing, matching, classifying; ranking, ordering, choosing; problem solving; listing implications, causes, and uses; data gathering; and providing directions. Some activities, like 4/3/2, do not have a demonstrable outcome but are meaning-focused because the speaker has a strong sense of speaking to an it may only be an audience of one person.

is by limiting

given to fluency activities. Only a relatively small amount of knowledge ... successful language use. It is important that this knowledge is available for use and therefore a part of class time should be given to fluency activities. Brumfit (1985) suggests: "Right from the beginning of the course, about a third of the total time could be spent on this sort of fluency activity, and the proportion will inevitably increase as time goes on."

If fluency activities are included in each lesson and make use of new language items taught in that lesson, then these items should occur at a low density in the fluency material. In listening material this means that at least 99 percent of the running words should be very familiar to the learners. A second alternative is to include fluency activities in each lesson that make use of items learned several days or weeks before. A third alternative is periodically to give large blocks of time to fluency activities.

Many fluency techniques involve the linking of skills. For example, reading is followed by listening, discussion is followed by listening, writing is followed by speaking. The reason for linking skills in this way is so that the earlier activities can provide preparation and support for the later activity. This preparation and support then allows a high level of performance to be reached in the later activity—much higher than there would have been if the later activity had not been linked with earlier activities.

CamScanner

knowledge of the language. The way that they affect this knowledge in turn relates to the development of fluency. We can distinguish three approaches to fluency development which can all usefully be part of a language course.

The first approach relies primarily on repetition and could be called "the well-beaten path approach" to fluency. This involves gaining repeated practice on the same material so that it can be performed fluently. The second approach to fluency relies on making many connections and associations with a known item. Rather than following one well-beaten path, the learner can choose from many paths. This could be called "the richness approach" to fluency. This involves using the known item in a wide variety of contexts and situations. Most of the suggested techniques in this chapter follow this approach. The third approach to fluency is the aim and result of the previous two approaches. This could be called "the well-ordered system approach". Fluency occurs because the learner is in control of the system of the language and can use a variety of efficient, well-connected, and well-practiced paths to the wanted item.

Fluency in Listening

development of fluency:

interesting

understand (bottom-up processing) (Richards, 1990). Most comprehension activities are a combination of these two approaches, but usually one is predominant. Fluency tasks should be largely top-down processing because these are the ones that allow learners to perform at speed without having to puzzle over language forms.

Top-down processing is encouraged by getting learners to listen when the topic is very familiar to them, when the organization and other genre conventions are familiar to them, when their attention is strongly focused on the message, and when there is not a concern for linguistic detail.

Bottom-up processing occurs when the main source of information is the text itself and the listener cannot draw on preparation and previous experience to assist in comprehension. Top-down and bottom-up processing tasks usually have different learning goals and set up conditions for different kinds of learning

In the **name it!** activity, the teacher says some sentences that describe something, for

incomplete statements, a table of statistics, the title of the talk (Watts, 1986). This is a kind of linked skills activity because discussion (the predicting) is followed by listening.

Techniques for Developing Fluency in Speaking

The speaking fluency activities make use of repetition and rehearsal and are discreet activities. It is also possible for theme-based work over several days to develop into fluency development opportunities.

The 4/3/2 technique has already been described. It combines the features of focus on the message, quantity of production (the speakers speak for a total of nine minutes), learner control over the topic and language used, repetition, and time pressure to reach a high rate of production through the decreasing amount of time available for each delivery.

The best recording is a useful fluency activity involving a tape or digital recorder or the language laboratory. The learner speaks onto the tape talking about a previous experience or

CamScanner

hese
o perform the asking and answering in front of the class at a
ractices asking and answering several times before doing their class presentation.

Rehearsed talks involve learners using the pyramid procedure of preparing a talk ndividually, rehearsing it with a partner, practicing it in a small group, and then presenting it to he whole class.

Activities described in other chapters of this book can be used to develop spoken fluency if the three conditions of limited demands, meaning focus, and a high level of performance are met. These activities include **ranking, information transfer, split information** activities, and **interviews**. Repeating an activity that was previously done with a language learning goal is a useful way of developing fluency. A gap of about a week or two is probably sufficient for enough memory of the previous activity to remain.

Monitoring Fluency Tasks

Examining the Context of the Material

When using experience tasks for language teaching, it is useful to have a way of checking the task are within the learners' experience and what part of the task is being There are four sets of goals—Language item goals; Idea or discourse goals. The mnemonic LIST can be used to experience task should have only one of experience. So, if the items

- Is the li

A checklist for observing a

- Are the learners interested in the act
- Are they easily able to find things to talk abo
- Are they speaking without a lot of hesitation?
- Are they speaking at a fast rate?

Fluency activities can also be monitored to see if learners are increasing
which they deal with tasks. Lennon (1990) found that over a period of several month
measures that showed a change were speech rate and filled pauses. It would be necessary to
make careful transcripts of recorded spoken production to measure such change, but teachers
may be able to make more subjective judgements that are of value.

Fluency is often a neglected strand of a course, probably because the teacher feels that
new material needs to appear in each lesson. Fluency development activities are a very useful
bridge between knowing and using.

CamScanner

- **Speech is talking.**

It involves coordinating the action of the muscles of the lips, jaw, tongue and vocal cords in the throat to produce recognizable sounds. A speech disorder may present as a hesitation or stutter when talking. It could also be Apraxia of speech where they have difficulty putting sounds and syllables in the correct order to form a word.

- **Most children develop receptive language skills before expressive language skills.**

This means they can understand instructions long before they can say the words. For example, a toddler may not say any words, but if they are asked to get their coat and shoes they are able to go and fetch them.

- **Most children and babies follow recognizable stages in their language development relatively predictable stages.**

children listen.

Turn-Taking

The richest talk involves many "back-and-forth" turns in which the provider builds on and connects with the child's statements, questions and responses. These extended conversations help children learn how to use language and understand the meaning of new words they encounter listening to other people or in reading books. They also often involve different kinds of sentences—questions and statements—and may include adjectives and adverbs that modify the words in children's original statements, modeling richer descriptive language.

One-On-One

Talking one-on-one gives the provider a chance to repeat (say back), extend (add to), and revise (recast or restate) what children say. Children have a chance to hear their own ideas reflected back. In addition, one-on-one conversations provide opportunities to either contextualize the conversation according to the individual child's understanding or tap children's understanding of abstract concepts. Caregivers should try to hold individual conversations with children each day.

CamScanner

Description

Narrating children's activities is a way for caregivers to not on vocabulary but also encourages deeper understanding of new words so they c and explain the meaning of these words. Narrating also introduces and il structures. Verbs, prepositions (such as for communicating direction, location), for characterizing intensity), and generally the kind of labeling that pl immediately in a natural context (because the objects or actions are present or moment). Describe what children are doing while they are doing it. Talk wit formal activities and in informal settings, such as snack, clean up, outdoor play with conversation about what children did during the activities.

Reading with Children is an Opportunity for Conversation

Sharing books with children offers one of the best opportunities for co uild oral language, especially when children are engaged in answering questions ooks with lots of interesting illustrations and simple text are best for enc ildren to talk about what is happening in the pictures and storylines. As chi oks are important in exposing them to new ideas, new words, and new worlds. lps children build oral language in a variety of ways—developing children' ening skills, introducing new concepts or information, and increasing both voca lity to define and explain the meanings of new words.

You can help focus children's attention on the vocabulary and concepts and for conversations after the shared reading experience. The types of books a difference in children's interest in and use of books for learning and enj ble children's books contain rich vocabulary in a natural context. They hav that might not otherwise come up in daily conversation, and those words te sentences in the books. There should be an adequate supply of books of d e to children—fiction and non-fiction, poetry, stories, children's reference b ries or encyclopedias) as well as "information books"–single-topic books features, characteristics, or circumstances of the topic, such as books o he weather, transportation— that allow children to get information or answ t have interesting content, rich vocabulary, and detailed illustrations are ildren build oral language and vocabulary, an understanding of the meani nd read, and an understanding of how language works,

Dialogic Teaching

Dialogic teaching is based on the premise that learning in schools is a social activity. Social aspects of classroom contexts which teachers can organize to help ensure the effectiveness of learning activities are:

- the fostering of a classroom community in which learning dialogues take place;
- the creation of activities which necessitate learning dialogues.

Learning dialogues are conversations in which challenging questions feature strongly. An open and inquisitive attitude is essential to learning dialogues. In learning dialogues different points of view are seen as a positive resource. Children are aware that through speaking and listening they are thinking together, and that focused talk is necessary to help everyone develop their ideas. In classrooms, learning dialogues are based on explicit learning objectives so that the children know what they are doing, why they are doing it, and how to achieve their objectives through discussion

ifferent times. The ultimate aim

dent readers. Guided reading offers learners th

advantage is that children in guided reading groups can tac

alone. They can gain satisfaction and confidence from this achieve

uiring skills and understanding about both the book and the process of reading

The teaching of literacy is driven by educational learning objectives, and by the child's sonal impulse and purpose. Guided reading, writing and speaking and listening provide cial contexts for learners. In these situations, learners move away from imposed expectations ards making use of literacy for their own purposes. Paradoxically, use of group work is a ng support for independence. In addition, guided groups offer increased skills, knowledge understanding of literate practices generally.

ided Reading as Exploratory Talk

Whatever the format of guided reading, it should include an element of exploratory talk ich is essentially a particular type of dialogue in which partners engage critically but structively with each other's ideas. The concept of exploratory talk is derived from the work Barnes who says, 'Exploratory talk is often hesitant and incomplete; it enables the speaker to ideas, to hear how they sound, to see what others make of them, to arrange information and different patterns'. Dialogic teaching of guided reading involves the teacher knowing The teacher takes the responsibility for upholding the ideas forward for the attention of thought-

CamScanner

Rationality is also not apparent in disputational talk. Children challenge one another's knowledge without offering reasons, and disagree with one another's ideas without offering alternatives. By rejecting ideas they appear to reject the person suggesting the idea

Exploratory talk allows a reasoned exchange of ideas and opinions. This sort of talk is likely to be of great value to the children educationally, because it means that they are using language to think rationally, and to consider and evaluate each other's ideas in a cooperative way. They can build up shared knowledge and shared understandings, as they engage in opportunities to collaborate as equals. Collaborative talk of this kind provides a supportive context for thinking aloud, and thinking aloud is crucial if children are to formulate their thoughts and ideas. It also represents the kind of rational, considered debate at the heart of 'educated' activities such as science, law and politics. Engaging in interthinking through rational discussion with other people is likely to help children develop clearer ways of thinking to ir development as an individual

One way of checking is called **test/retest**. In this procedu same people twice, usually with a gap of a week or so between reliable test should give very similar results on the two occasion called **split halves**. In this procedure the test is given to a group test is being marked the items in the test are split into two groups. make two equivalent forms of the same test. The two forms should possible without being exactly the same. When the same learners of the test, the scores for the two forms should be similar. What ways of checking reliability is that they are trying to see if the t occasions that it is used. If performance on the test keeps changing again, it cannot be measuring what it is supposed to be measu necessarily a valid test, but an unreliable test cannot be valid.

There are several features of listening and speaking tests th teachers can use these to guide their making and use of tests.

- A listening test will be more reliable if the material that the The tape recording ensures that whenever the test is used, the accent will be the same. This assumes that the quality of th tape and the room in which the tape is played provide consi tape-recording the listening input could make the test less valid
- A test is more reliable if it has several points of assessment. that a listening test consisting of 50 separate multiple-choice c to be more reliable than a test involving 12 questions based on speaking is more reliable if the speaker is assessed on sever several sub-skills of speaking rather than on one.
- A test is more reliable if it can be marked in relation to a set of marking is based on clearly understood criteria. Sometimes it some training if several are involved. Marking a dictation or example, requires a good understanding of the marking crite practice and discussion. Sometimes it is necessary to have t interviews or role plays (as well as making a recording for later markers significantly disagree).
- A test will be more reliable if the learners are all familiar with th worth giving a little practice in answering a particular type of te testing.

lidity

A test is valid if it measures what it is supposed to measure and signed. This last part of the definition of validity purpose but not valid whe

CamScanner

purpose. For example, a pronunciation test may be valid as a te
as a test of spoken communicative ability.

There are several kinds of validity, but because we
progress and diagnosis, the two kinds that most concern us
validity.

Face validity is a very informal judgement. It simply m
test, the people giving the test, and others affected by it su
government officials see the test as fair and reliable. A reliable te
and predictive validity may be so different from what the public
its poor face validity is enough to stop it being used. Good fac
reliability or other kinds of validity.

Content validity involves considering whether the conten
of the skill, language, or course being tested. For example, in orde
listening skill has content validity, we would need to decide what
demic listening skill and how is this skill used. We might decide t
note-taking, dealing with academic vocabulary, and seeing the org
discourse. Typically the listener has had some opportunity to rea
series of related lectures. The next step is to see how well the test
to see if it includes components that are not part of normal acade
the test matches well with the content of the skill, the test has hi
does not cover the components of the skill well, or includes other c
the skill, or requires the learner to process the components in an
content validity.

Practicality

Practicality can be looked at from several aspects: (1) e
labour; (2) ease of administration and scoring; and (3) ease of i
only be accurately determined in relation to a given situation, bu
short (notice that this may conflict with reliability), does not require
does not require many people to administer it, is easy to understan
or results which are easy to interpret, and can be used over and ov
validity. It is not easy to meet all these requirements and still have
tests are a compromise between the various criteria. When m
important that validity is not lost.

The Effect of a Test on Teaching

©Copyright Virtual University of Pakistan

CamScanner

One further criterion for a test is the influence of the for the classroom (this is sometimes called the "washback" effect). not test learners' oral proficiency in English. As a result much skills like reading and listening that are tested and very little time because it is not in the test. Here is another example. If the listen statements, this could have the effect of very little work being sentence level. A good test sets a good model for what should hap

Listening Tests

Dictation

The teacher reads aloud a text of approximately 150 words write each phrase as they hear it. This kind of test has been used proficiency (Oller, 1979).

Partial Dictation

The learners have an incomplete written text in front of the version of the text, they fill in the missing parts on the written text.

Text with Questions

The learners have a list of multiple-choice questions in fron a text being read or a recorded dialogue. As they listen they answer t

Responding to Statements

The learners listen to statements or questions and respond multiple-choice items of words or pictures, by indicating true or answer.

Three Choice True-false

Instead of responding to statements with just true or false, t are allowed true, false, opinion (Emery, 1980), or true, false, not state

Recorded Cloze

The learners listen to a tape recording where every 15th wo "bleep" sound and with pauses at the end of each sentence. As they l missing words (Templeton, 1977).

THE RESEARCH SPACE: PARADIGM

Classical Research Paradigms in Relation to Researching Sp

Different research approaches are often called 'paradig how research is carried out. A paradigm functions as a framew researchers and users of research output. It gives coherence to others providing shorthand by which it can be prepared and ju study in, for example, an experimental paradigm he or she cre her audience about the way the research will be conducted. research is received.

A paradigm is a framework for ideas which includes relationships between them. The framework is coherent beca things as a starting point and new knowledge is absorbed disciplines work within different paradigms and even with several paradigms can compete with one another. Most re changes to the paradigm rather than altering it fundamenta findings generally. Paradigm shifts can and do occur when e compel others to change their mental map of a particular findings or arguments.

All paradigms orient towards a theory and towards will differ according to the tradition in which the academi meaningless if it is not embedded in the context of the w framed within a paradigm that has a particular orientation disciplines will also place different emphasis on the role of t

The following table gives an indication of how branches of linguistics deal with situated data, whether t contrast deal primarily with abstractions.

Levels of Analysis

One of the difficulties in researching speech is the fact that, un notion of a freestanding genre or clearly delimited sample to be investig lend itself to speech. Whereas the researcher into writing can start, if they well-defined set of texts that clearly fit into a category (newspaper lang advertising texts, academic writing and so on), the researcher into speech such helpful categories to hand. Writing presents itself in front of the materiality of its visual medium. The researcher into speech must usuall course to the context in order to delimit the data under investigation and instance, comparing like with like.

Analyzing speaking skills at the level of discourse and social interactio

Discourse-level studies are interested in questions of how spea another (for example, how they know when it is their turn to speak), and l particular kinds of patterns over long stretches of language (for example, their talk for listeners so that they can follow changes in topic eas researchers are often also interested in how, through talk, social features identity, shared knowledge, or power relations. Many disciplines becoming increasingly interested in discourse analysis because of the ir how participants in a spoken interaction behave.

Both discourse analysis and conversation analysis have links to they prefer not to deal with samples of language in isolation, and particular is interested in the relations between interlocutors. Discours traditionally tended to concentrate on longer sections of language and between different sections of text. Within this, the discourse analyst is in carry out functions of language and the choices made by them in differe

During the 1990s and beyond there was increasing interest in the computing world that discourse analysis would solve problems of computer understanding. This area has not achieved the early pro constrained to limited lexical choices and clear talk in these contexts rat able to adjust to spontaneous talk. Nevertheless, it will be interesting century discourse and conversation analysis can offer other disciplin apply the insights of linguistics to real-world applications.

The relationship between psychology and speech behavior is a into global aspects of speech, and one which again links in with the spoken language data relate to underlying linguistic systems, whether r genetic. Whereas discourse or conversation analysts will describe patte

existing questions/hypotheses to the appropriate methods t
looking at the frequency of a feature in natural data or design
to elicit speech data and then analyze this. Very often, whate
the findings are analyzed by means of statistics and these g
generalizing from particular results to something beyond the d
you predicted in this approach is almost as interesting as finding
would be the case, and this is part of the strength of the approach

Quantitative approaches tend to analyze data in terms of
researcher then seeks to investigate the nature of these items
ynamic and socially grounded as spoken discourse, this use of pr
nhelpful. The strength of the qualitative paradigm is that it works
talk towards patterns and regularities and is able to uncover asp
t have imagined existed.

A widely used method among the qualitative approaches
nversation analysis (CA). This method puts high value on the car
l (i.e. non-elicited) talk to understand how speakers create m
course as social action. The CA analyst is interested also in what l
sody, gaze, laughter, silence, and so on) speakers use to 'do talk' a
specific varieties of language and discourse contexts. The 'pure' (
que in that it seeks to understand the nature of speech primarily
ited data and through this process gain insights about broader
ularities appearing in the interaction.

Two contrasting studies dealing with the same linguistic phe
erences between quantitative and qualitative approaches to research
l. (2008) and Mushin and Gardner (2009) both deal with the topic
versational interaction. The former follows a classic quantitative ap
d on previous work (evidence from corpora that filled pauses precede
othesis (that listeners interpret a filled pause as a precursor of a com
), an experiment designed to test the hypothesis (participants asked to
shape with and without a filled pause preceding it and press a bu
hed description to shape) and analysis of the time taken to make the
itions by means of statistics.

Mushin and Gardner (2009) were also interested in understa
ersational pauses but in sharp contrast to Watanabe *et al.* (2008) u
tical approach to probe the topic. In something of a return to CA's ethn
tigated Australian Aboriginal talk and began from assumptions foun
es that silence is used differently in Aboriginal and in white Australia

transforming this into a formal research question and hypotheses as the quantitatively oriented academics might, they use it as a jumping-off point for a series of rhetorical questions. These provide the link between previous findings and the current study and explain to the reader what interests them and motivates the study.

Theory-Driven, Positional, or Ideas-Based Approaches to Researching Speaking

All research is about theory and ideas, however in some work the questioning of the theory or the discussion of a possible alternative theory is the *primary* focus of the study. These studies are interesting because they can question how an aspect of speaking is conceptualized and researched and, if they lead to challenging debate about their strengths and weaknesses among other scholars, they are extremely influential. Liberman (1998) 'When theories of speech meet the real world' is an example of what is known as a 'position paper'. This means that the research text in question (they are generally journal articles) encapsulates an academic's stance on a broad topic and they generally deal with an issue that is open to debate. These can be difficult to write as there is a need to understand the ideas being criticized summarize the relevant arguments and present a coherent alternative to them.

Theoretical research questions very often begin life as 'what if ...?' thoughts, and in a ' these can, and are often intended to, present fundamental challenges to existing that even the most robust theoretical thinkers are

transition. ...ained static and, in particular, the decade of the 1970s marked a ...language classroom. However, the status and handling of ...spoken form has for a long time

The language learner in a 1950s and 1960s classroom would have had a very high chance of being exposed to the spoken form. Indeed the influence of early British applied led to a strong emphasis on the oral mode. What emerged as 'The Natural Method' relied on introducing language items systematically and almost entirely through speech, and then on the very accurate (in phonetic terms) oral practice of explicitly taught language rules and features. In the United States, ethnographic approaches which depended on close and careful scrutiny of the oral form were also influential and these were superseded by what eventually became known as 'The Audio-lingual Method'. This again relied heavily on oral input, exposure to native-speaker models, and repetitive oral work ('drilling') which could be carried out with very little reference to meaning or context. It was the 'medium' or container of carefully selected (in the better programmes) linguistic items that would flourish in this sheltered environment and then become automatic and natural for the learner who had absorbed and internalized them through extensive practice. The focus was not primarily on communication but on structure and accurate production. There was, however, a gradual acknowledgment from the late 1960s onwards that language rules and explicit focus on input and practice could only take the learner so far.

CamScanner

acqui... (see for instance, Ellis, 1986). The significant impact that the ideas had means that Krashen's ideas are retained in the standard English language teacher training syllabus and the focus on interaction rather than explicit instruction that they promoted provides part of the explanation for the strong focus on speaking in language acquisition that remains to this day. As noted, the change of emphasis from explicit tuition and drilling to looking at language in use was also shared by the Communicative Language Teaching movement that began to be highly influential from the early 1970s.

The Role of Spoken Interaction in Communicative Language Teaching Classrooms

The Communicative Language Teaching (CLT) approach that has dominated English language teaching from the 1980s if not earlier and the Natural Approach that retains a strong influence on teacher training were developed around the idea of meaningful interaction and the focus on communication rather than linguistic facts. Both therefore valued, and were interested in encouraging students to engage in, abundant amounts of spoken language in the classroom.

The handling of classroom talk has therefore become something of a marker of ability to promote good language learning environments. It is also used as a measure of the level of learner

CamScanner

needed for successful

language to ask further questions about the difficulties they are encountering.

Three basic aspects of spontaneous speech that language learners need to be aware of and which language teachers may find helpful to reflect on with their students are:

- speaking is fundamentally an interactive process and is defined by interactivity;
- speaking happens under real-time processing constraints;
- speaking is more fundamentally linked to the individual who produces it than the written form is.

These are the elements that stem directly from the way speech is produced and distinguish it from standard written forms. An awareness of the effects of the interactive, spontaneous and personally oriented nature of speech can, therefore, be of great benefit to learners, both in terms of confidence in production and also to help to improve global listening skills. If, however, speech is taught without greater regard for some of the basic features that shape the process of listening and speaking then learners will constantly be striving, and failing, to speak in the complete, grammatically standard, and impersonal discourse that is quite untypical of naturally occurring speech.

current topic for scholarly debate and classroom

Task-Based Language Teaching – TBLT

This is an approach to language learning based on insights first outlined in the late 1980s by Prabhu (1987) and which has remained a central topic in syllabus design and debate about language learning generally. Reporting on his work in India, Prabhu suggested that learners who were mainly focused on a real world task made as good if not better progress than language learners given explicitly language focused instruction. This led to a variety of attempts to implement 'task-based learning' more widely and to relate them to the language classroom more generally. This was done by designing tasks that promoted the use of authentic language and required active engagement by the student in their completion, generally with a high level of spoken interaction being required.

A typical pattern for a lesson would be to provide an introduction to the task in the form of a 'warm-up' discussion to focus the attention of the students on the topic in question and help

Speaking and Neuro-Linguistic Studies

Neuro-linguistics differs from psycholinguistics in that the focus of research is on the biological and neurological basis of language processing. As such, research into fundamental aspects of speech can be investigated within neuro-linguistic frameworks. It is interesting to note how little either psycho- or neurolinguistics affects mainstream applied linguistics and language teaching, despite a long and reputable research tradition. There is, however, a strong link existing between this field and speech pathology/therapy.

Speaking and Corpus Linguistics

Until relatively recently the greatest part of corpus work in linguistics was based on written evidence and overall the balance remains in favor of the written mode. This is due to the
