Question No: 41 (Marks: 10)

Define the following term with examples

- 1- Sunk cost
- 2- Implicit cost
- 3- Explicit cost
- 4- Opportunity cost
- 5- Historic cost

Answer :

- 1- **Sunk cost :** Sunk cost refers to the cost that has been spent in the past and that cannot be retrieved on product or service in the current

period. This cost should not be taken into account while making the decisions by management.

Example

Stationary bought in bulk last month. In this case the cost has been incurred and will not be important to management decisions being made for the future..

2-Implicit cost : Implicit cost is the cost imposed on a firm for foregoing an alternative but where the actual payment for the alternative taken is not involved

Example :

Use of company's capital for investment

Use of the owner's time

Use of the owner's land for investment

3-Explicit cost : This is subject to actual payment or will be paid in the future.

Example : 1) Actual payment made to buy land for expansion of the company instead of using the owner's land.

2) Payment made for wage, rent or material etc.

4-Opportunity cost : Opportunity cost is the cost of sacrificing a benefit by choosing some other alternative. This is the cost of foregoing an alternative in favour of some other alternative.

Example : 1) If the owner of a company further invests money in his business instead of keeping it in the bank in a savings account then the opportunity cost in this case will be the yearly interest that the bank would have paid to him had he chosen the alternative of keeping the money in the savings account. The investment made in the business should give him more return than the opportunity cost if it is to be deemed a better investment.

2) Instead of investing in his hotel for increasing profits, if an owner invests in some other investment then the loss of the increase in profits in the hotel is an opportunity cost for the owner.

5-Historic cost : Historic cost is the cost that is incurred at the time of making transaction and can be verified through purchase agreement or invoice. It is used in financial accounting for valuing assets of the company as opposed to market value which is used in financial management. The

Examples : 1) Cost paid to acquire a land for investment purpose.

2) Cost incurred to buy Machinery as capital expenditure for manufacturing business

Question No: 41 (Marks: 10)

The Mars Company applies factory overheads to production by means of pre-determined rate based on expected actual capacity. Factory overhead at expected actual capacity of 120,000 hours is Rs. 240,000 of which Rs. 60,000 is fixed and Rs. 180,000 is variable. Normal capacity of the company is 150,000 hours. The actual capacity attained during the year was 100,000 hours and actual factory overhead was Rs. 180,000.

Calculate: Pre-determined overhead rate based on expected actual capacity and normal capacity.

1. Over-applied or under-applied factory overhead based on rate used by the company.
2. Budget variance and volume variance.

Pre-determined overhead rate based on expected actual capacity

Fixed FOH rate = fixed FOH cost/ expected actual capacity

$$= 60000/120000 = 0.50$$

Add variable FOH rate =

$$\text{Variable FOH cost for expected actual capacity/ expected actual capacity} = 180000/120000 =$$

$$1.50$$

FOH applied rate based on expected actual capacity

$$2.00$$

Pre-determined overhead rate based on normal capacity

Fixed FOH rate = fixed FOH cost/ normal capacity

$$= 60000/150000 = 0.40$$

Add variable FOH

$$\text{rate} = 1.50$$

Pre-determined overhead rate based on normal capacity

$$= 1.90$$

1) . Over-applied or under-applied factory overhead based on expected actual capacity

$$\text{Actual FOH cost} = 180000$$

Applied FOH cost

$$= \text{actual capacity} * \text{FOH rate}$$

$$= 100000 \times 2.00 = 200000$$

Over applied FOH cost	20000
-----------------------	-------

2) Budget variance at expected actual capacity rate

Actual FOH cost	=		180000
Estimated FOH cost at actual capacity			
Fixed FOH cost	=	60000	
+ Variable FOH cost			
= actual capacity*variable rate			
= 100000*1.50	=	150000	210000
Favorable			30000

Volume variance of expected actual capacity rate

Estimated FOH cost at actual capacity	210000
Applied FOH cost	200000
Unfavorable	(10000)

- ▶ They are used to charge overheads to product
- ▶ They are based on actual data for each period
- ▶ None of the given options

Question No: 41 (Marks: 10)

The Mars Company applies factory overheads to production by means of pre-determined rate based on expected actual capacity. Factory overhead at expected actual capacity of 120,000 hours is Rs. 240,000 of which Rs. 60,000 is fixed and Rs. 180,000 is variable. Normal capacity of the company is 150,000 hours. The actual capacity attained during the year was 100,000 hours and actual factory overhead was Rs. 180,000.

Calculate: Pre-determined overhead rate based on expected actual capacity and normal capacity.

1. Over-applied or under-applied factory overhead based on rate used by the company.
2. Budget variance and volume variance

The Mars Company applies factory overheads to production by means of pre-determined rate based on expected actual capacity. Factory overhead at expected actual capacity of 120,000 hours is Rs. 240,000 of which Rs. 60,000 is fixed and Rs. 180,000 is variable. Normal capacity of the company is 150,000 hours. The actual capacity attained during the year was 100,000 hours and actual factory overhead was Rs. 180,000.

Calculate:

Pre-determined overhead rate based on expected actual capacity and normal capacity.

1. Over-applied or under-applied factory overhead based on rate used by the company.
2. Budget variance and volume variance

Solution

Pre-determined overhead rate based on expected actual capacity

Fixed FOH rate = fixed FOH cost/ expected actual capacity = $60000/120000 = 0.50$

Add variable FOH rate =

Variable FOH cost for expected actual capacity/ expected actual capacity

= $180000/120000 = + 1.50$

FOH applied rate based on expected actual capacity **2.00**

Pre-determined overhead rate based on normal capacity

Fixed FOH rate = fixed FOH cost/ normal capacity =60000/150000 = 0.40

Add variable FOH rate = + 1.50

Pre-determined overhead rate based on normal capacity = 1.90

1) . Over-applied or under-applied factory overhead based on expected actual capacity

Actual FOH cost = 180000

Applied FOH cost

=actual capacity * FOH rate

=100000*2.00 = 200000

Over applied FOH cost 20000

2) Budget variance at expected actual capacity rate

Actual FOH cost = 180000

Estimated FOH cost at actual capacity

Fixed FOH cost = 60000

+ Variable FOH cost

= actual capacity*variable rate

=	100000*1.50	=	<u>150000</u>	<u>210000</u>
Favorable				<u>30000</u>

Volume variance of expected actual capacity rate

Estimated FOH cost at actual capacity	210000
Applied FOH cost	<u>200000</u>
Unfavorable	<u>(10000)</u>

Note

Variable FOH rate always fixed at all capacity levels so it would be same for all

Differentiate between process costing and job order costing.

Process costing

It is a method of cost accounting applied to production carried out by a series of operational, stages or processes. It is a continuous production process. In process costing all units produce are similar. The whole process is divided into several departments.

Job order costing.

The costing system that separately accumulates costs incurred to produce each job in a situation where each job is distinguishable from the other throughout the production process. The job may be a single unit or a multi unit batch, a contract or a project, program or a service. Job costing is employed by organizations possessing following characteristics.

1. Every order has its own manufacturing specifications. Therefore, every job is different from the other and requires different amounts materials, labor and overhead.
 2. Each job is clearly distinguishable from the other at all stages production process which makes job wise accumulation of possible.
 3. Each job is generally of high value.
 4. Production is generally in response of customers' orders
 5. Job wise accumulation of cost is desirable and/or necessary for and profit determination.
- Job costing is more expensive as compared with process costing.

Question No: 41 (Marks: 10)

Differentiate between process costing and job order costing.

Process costing

It is a method of cost accounting applied to production carried out by a series of operational, stages or processes. It is a continuous production process. In process costing all units produce are similar. The whole process is divided into several departments.

Job order costing.

The costing system that separately accumulates costs incurred to produce each job in a situation where each job is distinguishable from the other throughout the production process. The job may be a single unit or a multi unit batch, a contract or a project, program or a service. Job costing is employed by organizations possessing following characteristics.

1. Every order has its own manufacturing specifications. Therefore, every job is different from the other and requires different amounts materials, labor and overhead.
2. Each job is clearly distinguishable from the other at all stages production process which makes job wise accumulation of possible.
3. Each job is generally of high value.
4. Production is generally in response of customers' orders
5. Job wise accumulation of cost is desirable and/or necessary for and profit determination.

Job costing is more expensive as compared with process costing.

Job order costing

Generally, it is the allocation of all time, material and expenses to an individual project or job.

as two ends of a spectrum or range. In practice we find companies employing either one of

these two or some combination of features of the two both of these at the same time. For

example, a ready made garments manufacturer employs process costing to accumulate and

determine the cost of free size shirts produced by him in large quantity. At the same time he

uses job costing to accumulate the cost of waiters' uniforms supplied to a hotel under a

contract.

Example

Stationary bought in bulk last month. In this case the cost has been incurred and will not be important to management decisions being made for the future..

- 2-**Implicit cost :** Implicit cost is the cost imposed on a firm for foregoing an alternative but where the actual payment for the alternative taken is not involved

Example :

Use of company's capital for investment
Use of the owner's time
Use of the owner's land for investment

Particulars	Rs.
Cost of goods sold	30,000
Inventory, January 1	9,000
Inventory, December 31	7,800

Question No: 41 (Marks: 10)

The Mars Company applies factory overheads to production by means of pre-determined rate based on expected actual capacity. Factory overhead at expected actual capacity of 120,000 hours is Rs. 240,000 of which Rs. 60,000 is fixed and Rs. 180,000 is variable. Normal capacity of the company is 150,000 hours. The actual capacity attained during the year was 100,000 hours and actual factory overhead was Rs. 180,000.

Calculate: Pre-determined overhead rate based on expected actual capacity and normal capacity.

1. Over-applied or under-applied factory overhead based on rate used by the company.
2. Budget variance and volume variance.

Pre-determined overhead rate based on expected actual capacity

Fixed FOH rate = fixed FOH cost/ expected actual capacity = $60000/120000 = 0.50$

Add variable FOH rate =

Variable FOH cost for expected actual capacity/ expected actual capacity
 $= 180000/120000 = 1.50$

FOH applied rate based on expected actual capacity 2.00

Pre-determined overhead rate based on normal capacity

Fixed FOH rate = fixed FOH cost/ normal capacity $= 60000/150000 = 0.40$

Add variable FOH rate = 1.50

Pre-determined overhead rate based on normal capacity = 1.90

- 1) . Over-applied or under-applied factory overhead based on expected actual capacity

Actual FOH cost = 180000

Applied FOH cost

= actual capacity * FOH rate

= $100000 * 2.00 = 200000$

The Mars Company applies factory overheads to production by means of pre-determined rate based on expected actual capacity. Factory overhead at expected actual capacity of 120,000 hours is Rs. 240,000 of which Rs. 60,000 is fixed and Rs. 180,000 is variable. Normal capacity of the company is 150,000 hours. The actual capacity attained during the year was 100,000 hours and actual factory overhead was Rs. 180,000.

Calculate:

Pre-determined overhead rate based on expected actual capacity and normal capacity.

1. Over-applied or under-applied factory overhead based on rate used by the company.
2. Budget variance and volume variance

Solution

Pre-determined overhead rate based on expected actual capacity

Fixed FOH rate = fixed FOH cost/ expected actual capacity = $60000/120000 = 0.50$

Add variable FOH rate =

Variable FOH cost for expected actual capacity/ expected actual capacity
 $= 180000/120000 = + 1.50$

FOH applied rate based on expected actual capacity **2.00**

Pre-determined overhead rate based on normal capacity

Fixed FOH rate = fixed FOH cost/ normal capacity $= 60000/150000 = 0.40$

Add variable FOH rate $= + 1.50$

Pre-determined overhead rate based on normal capacity **= 1.90**

1) . Over-applied or under-applied factory overhead based on expected actual capacity

Actual FOH cost	=	180000
<u>Applied FOH cost</u>		
=actual capacity * FOH rate		
=100000*2.00	=	<u>200000</u>

Over applied FOH cost		<u>20000</u>
------------------------------	--	---------------------

2) Budget variance at expected actual capacity rate

Actual FOH cost	=	180000
<u>Estimated FOH cost at actual capacity</u>		
Fixed FOH cost	=	60000
+ Variable FOH cost		
= actual capacity*variable rate		
= 100000*1.50	=	<u>150000</u>
Favorable		<u>30000</u>

Volume variance of expected actual capacity rate

Estimated FOH cost at actual capacity	210000
Applied FOH cost	<u>200000</u>
Unfavorable	<u>(10000)</u>
