**Question:**

**Lipids are major source of energy in contrast to carbohydrates and proteins. Just above statement with reason if it is true.**

**Solution:**

Lipids are major source of energy this is a true statement.

Justification:

Lipids are an efficient source of energy (9kcal per gram) that **the body stores in relative abundance**. They also play an important role as building blocks for cell membranes, hormones, and physiologically active substances. Lipids are essential for cells to function properly.

**In contrast to carbohydrates:**

Glycogen provides a ready source of energy, lipids primarily **function as an energy reserve**. Glycogen is quite bulky with heavy water content, thus the body cannot store too much for long. Fat is used for energy during exercise, especially after glycogen is depleted.

**Lipids act as energy reserve, regulate hormones, transmit nerve impulses, cushion vital organs, and transport fat-soluble nutrients**.
