ENG505

SUBJECTIVE PART

BY NIMMA MALIK

Long's classroom centered

Classroom research is a recent trend that has been emerging due to severe need of designing lessons according to specific needs of learners. As pointed out by Long (1983), classroom centered research is 'eminently practical' because it is 'concerned with what actually goes on in the classroom as opposed to what is supposed to go on' (p. 284). By definition, Classroom-Centered Research (CCR) views classroom as the 'object' of research, and not simply the 'setting' for research. The CCR determines not only what happens in the classroom but also the conditions that can affect teaching and learning processes. It is observed that sometimes simple research results do not leave any impact unless they are empirically tested

Types of intelligence

Sternberg (1985, 2002) distinguishes three types of intelligence:

1. Analytical — the ability to analyze, compare, and evaluate

2. Creative — the ability to produce novel solutions to problems

3. Practical — the capacity to adapt, to shape, and to select environments suited to one's abilities

Cognitive motivation

Cognitive motivation refers to the mental processes that drive individuals to achieve goals, solve problems, and engage in activities that they find intellectually stimulating or

challenging. Unlike basic physiological drives, cognitive motivation is rooted in higher-order thinking and involves various cognitive functions such as planning, decision-making, and problem-solving.

Understanding cognitive motivation is essential for designing effective educational programs, workplace environments, and personal development strategies. By recognizing the cognitive factors that influence motivation, individuals and organizations can create conditions that foster engagement, persistence, and achievement.

Characteristics of competence

Competence encompasses a range of characteristics that enable an individual to perform tasks effectively and achieve desired outcomes. Here are key characteristics of competence:

1. Skill Proficiency
2. Knowledge
3. Ability to Apply Knowledge
4. Experience
5. Adaptability
6. Problem-Solving Skills
7. Emotional Intelligence
8. Motivation and Commitment
9. Self-Regulation

By developing these characteristics, individuals can enhance their competence and achieve success in various aspects of their personal and professional lives.

Differences in traditional and 21th century classroom environment

The shift from traditional classroom environments to 21st-century classroom environments has brought significant changes in teaching methods, learning experiences, and the overall educational atmosphere

Traditional Classroom Environment:

- **Role of Teacher:** The teacher is the primary source of knowledge, delivering information through lectures.

- **Student Role:** Students passively receive information and are expected to memorize and recall it.
- **Testing**: Emphasis on standardized tests and exams to measure student performance.
- **Grading**: Grades are the primary measure of student achievement.

21st-Century Classroom Environment:

- Role **of Teacher**: Teacher acts as a facilitator or guide, encouraging students to explore and discover.
- **Student Role**: Students actively participate, collaborate, and engage in their learning process.
- 21st century classroom requires a learning environment where teaching and learning are facilitated and **higher-order thinking skills** are developed. The effectiveness of ESP learning is specific to the construction of knowledge in a **social context** (Duffy & Jonassen, 1991), such as, classrooms and language laboratories 'where students join in manipulating materials and, thus, create a community of learners who built their knowledge together' (Dewey, 1966).

Characteristics of research

Alami (2015) proposed **five main characteristics** of research within applied linguistics namely:

1) Empirical
2) Logical
3) Reductive
4) Planned
5) Imaginative

Whereas, McDonough and McDonough (2005) sum up research in **four features**:

1) interest
2) originality
3) specificity
4) Dissemination of both research questions and findings.

Nunan (2005, p. 226-227) contribution in determining the nature of the term rests on the concept of enquiry: product and process.

Write Kolb's Learning Style Model

Kolb's model is based on a **four-stage** learning cycle which proposes that the learning styles contain concrete vs. abstract and active vs. reflective dimensions. Concrete experiences rely on accommodating and diverging components as feelings specific whereas abstract conceptualization focuses on converging and assimilating as thinking and doing continuum. Both active and reflective domains are observed on the processing continuum.

Explain Myers-Briggs Model

The Myers-Briggs Model (Briggs & Myers, 1975; or Briggs et al., 1980) classifies the individuals according to their preferences on scales derived from the theories of psychological types developed by Carl Jung who believes that behaviour is never random and reflective of one's distinctive mental capacities. According to the Myers-Briggs Model, learners may be:

1) **Extroverts:** Learn best when they can work with a friend and learn by trying something themselves
2) **Introverts:** Learn best when they can find quiet places to work and have enough time to reflect on.
3) **Sensors:** Learn best when they can ask their teacher to explain. They like to use computers, watch films etc.
4) **Intuitors:** Learn best when they can find ways to be imaginative and creative.
5) Thinkers: Learn best when they have limited time to do their work, or when they are able to put information in a logical order.
6) **Feelers:** Learn best when they can work with a friend and have opportunities to choose topics. They care about and help others.
7) **Judgers:** Learn best when they have short-term goals, and they are able to make a plan of action.
8) **Perceivers:** Learn best when they find new ways to do routine tasks in order to generate interest.

Technology-based learning in Pakistan Importance.

Technology-based learning in Pakistan is becoming increasingly important for several reasons, significantly impacting the education system and the country's overall development. Here are some key aspects of its importance:

1) Improving Access to Education
2) Enhancing Quality of Education
3) Promoting Lifelong Learning
4) Supporting Teacher Development
5) Addressing Educational Inequities
6) Promoting Digital Literacy
7) Enhancing Collaboration and Communication
8) Encouraging Innovation and Creativity
9) Preparing for the Future
10) Crisis-Resilient Education

The importance of technology-based learning in Pakistan cannot be overstated. It provides a pathway to a more inclusive, flexible, and high-quality education system that can better meet the needs of all learners. By embracing and effectively integrating technology in education, Pakistan can address existing educational challenges, enhance learning outcomes, and prepare its population for the demands of the 21st century.

Three features of noticing?

The following are the features of Noticing Hypothesis:

1) Noticing as focal awareness
2) Noticing refers to a private experience
3) Consciousness as knowledge

Explain Noticing hypothesis

Schmidt proposed the concept of 'Noticing'; he believed that 'noticing is the necessary and sufficient condition for converting input into intake' (Schmidt, 1990, p. 130). The concept came in response to Krashen's claim that subconscious processes can guarantee successful L2 acquisition. Schmidt argued that noticing is important for L2 learning.

From Schmidt's perspective, for learning to occur, **attention and a low level of awareness** (i.e. noticing)–'conscious registration of the concurrence of some event' (Schmidt, 1995, p. 29)–are necessary, but high level awareness (i.e. understanding)–'recognition of a general principle, rule, or pattern' (Schmidt, 1995, p. 29)–is not required (Ahn, 2014).

The following are the features of Noticing Hypothesis:

1) Noticing as focal awareness
2) Noticing refers to a private experience
3) Consciousness as knowledge

To overcome the ambiguities between conscious and unconscious learning, Schmidt explained that unconscious learning deals with unawareness of having learned something. Conscious learning establishes the awareness at the level of noticing, whereas, unconscious learning ends into picking up speech without noticing. He calls this process 'subliminal' learning

What is Speech act?

'Speech Acts' are the utterances which fulfill certain actions of what is said by people in the course of interpersonal communication. Learning how to perform these acts in the L2 is central to language learning, and knowing when to deploy them is basic to what we call pragmatic competence.

Explain Proficiency Assessment

Proficiency Assessment is concerned with the general versus specific performances or knowledge. The types include:

- Discrete-point versus integrative assessment

- Direct versus indirect assessment
- Objective versus subjective assessment
- Group testing versus individual assessment

What is General course in language class room?

A general course in a language classroom typically covers a range of topics and activities designed to develop proficiency in the target language. Here are some key components you might find in a typical language course:

1) Grammar
2) Vocabulary
3) Listening
4) Speaking
5) Reading
6) Writing
7) Culture and Context
8) Interactive Activities
9) Language Skills Integration
10) Assessment and Feedback

What is Social Psychology?

Social Psychology is a sub-field of psychology that studies how others influence our thoughts, feelings, and actions. The theory of social psychology examines the effects of large social forces and the ways different people act in the same and different situations. It involves the following factors:

- **Social Influence** – one's behaviour affected by others presence
- **Social Cognition** – ways of thinking about others
- **Social Interaction** – people relating to others

What is Explicit and Implicit learning according to Dornyei's?

Explicit learning refers to the **learner's conscious and deliberate attempt** to master some material or solve a problem. Learners actively engage in studying grammar rules, vocabulary lists, and language structures through formal instruction, explanations, and explicit practice.

Implicit learning involves acquiring skills and knowledge without conscious awareness, that is, automatically and with no conscious attempt to learn them. Learners acquire language knowledge and skills implicitly through exposure, interaction, and usage without necessarily being aware of the underlying rules.

Awareness, according to **Tomlin and Villa** (1994, p. 193), is 'a particular state of mind in which an individual has undergone a specific subjective experience of some cognitive content or external stimulus.'

Write Celce-Murcia's model of communicative competence.

1. Socio-culture competence

2. Discourse competence

3. Interactional competence

4. Linguistics competence

5. Formulaic competence

6. Strategic competence

Explain teaching methods by krashen's comprehensible input

Stephen Krashen's comprehensible input hypothesis suggests that people learn languages best when they hear or read language that is just a bit more advanced than what they currently understand, but still makes sense to them. This idea has led to the development of several teaching methods that help learners pick up a new language in an effective and natural way. Here are some methods that align with this hypothesis, explained in simple terms:

1. Total Physical Response (TPR)

2. Storytelling

3. Sheltered Instruction

4. Language Experience Approach

5. Visual Aids and Realia

6. Contextual Learning

7. Scaffolding

By using these methods, teachers can create a learning environment where students naturally pick up the language through exposure to understandable, slightly challenging language, in line with Krashen's comprehensible input hypothesis.

Schmidt suggests principles for conscious and unconscious learning explain one principle

One principle suggested by Richard Schmidt is **noticing**.

Schmidt proposed the concept of 'Noticing'; he believed that 'noticing is the necessary and sufficient condition for converting input into intake' (Schmidt, 1990, p. 130). The concept came in response to Krashen's claim that subconscious processes can guarantee successful L2 acquisition. Schmidt argued that noticing is important for L2 learning.

From Schmidt's perspective, for learning to occur, **attention and a low level of awareness** (i.e. noticing)–'conscious registration of the concurrence of some event' (Schmidt, 1995, p. 29)–are necessary, but high level awareness (i.e. understanding)–'recognition of a general principle, rule, or pattern' (Schmidt, 1995, p. 29)–is not required (Ahn, 2014).

The following are the features of Noticing Hypothesis:

1) Noticing as focal awareness

2) Noticing refers to a private experience

3) Consciousness as knowledge

What are Factors affecting SLA?

1) Internal Factors:

Age, Personality, Motivation (intrinsic), Experience, Cognition, and Native language

2) External Factors:

Culture and status, Motivation (extrinsic), Access to native speakers, Curriculum, and Instruction

What are six principals of Schmidt's?

Here are six principles of Richard Schmidt's theory of second language acquisition:

1) Noticing
2) Attention
3) Input
4) Output
5) Awareness
6) Interaction

Interplay between research and teaching explain.

The interplay between research and teaching is explained by the following researchers:

- Pica (2005) mentions that 'as teachers and researchers, we cannot work in isolation to each other if we are to help our students meet their needs and accomplish their goals' (p. 49).

- Teachers should know what students learn, how and why instruction influences such learning, and how lessons could be based on this information to be more influential when teaching them next time (Berk, Hiebert, Jansen, & Morris, 2007).

- Some linguists (cf. Robinson, 1991) believe that it is wrong to isolate language into items and present them according to the coverage, range, and frequency. It is believed that this is a mechanical way of introducing language. It is better to present language as a whole in chunks, however (cf. Widdowson, 1990). Language is for communication not for exercising linguistic items.

What is Cognitive Ability?

It is the ability to carry out any task from the simplest to the most complex. It is more to do with the mechanisms of how we learn, remember, problem solve, and pay attention rather than with any actual knowledge (brain based skills).

What are three types of social theory?

1) Structural Functionalism
2) Conflict Theory
3) Conflict Theory

What is Separate Underlying Proficiency (SUP)?

Separate Underlying Proficiency (SUP) is a concept in second language acquisition that suggests learners have two distinct language proficiencies: one for their first language (L1) and one for their second language (L2),

Example:

A student may excel in conversational English (L2) but find it difficult to write an academic essay because the skills required are different from those in their first language.

Understanding SUP helps educators tailor their teaching strategies to support language learners more effectively!

Difference between behaviorism and cognitivism.

Aspect	**Behaviorism**	**Cognitivism**
Focus	Observable behaviors	Mental processes
Learning Process	Conditioning	Information processing
Role of Learner	Passive	Active
Key Theorists	B.F. Skinner, John Watson	Jean Piaget, Jerome Bruner
Example	Rewards for correct answers	Understanding concepts
