ECO607 - Mathematical Economics II

Question # 1:

Which of the following is the correct option for the dynamic stability of equation; Pt = P0(1+i)t ?

The term(1+i)t will affect the scale of complementary solution

The term t will determine the magnitude of scale

✅ The term(1+i)t will determine the dynamic stability of the equation

The term P0 will determine the dynamic stability of the equation

Question # 3:

Which of the following is the correct option for the dynamic stability of price equation; When n>0 ?
P''+mnp'+[−β+δn]P=−α+γn

The system will dynamically stable with A1 >0 and A2 = 0

The system will be dynamically undefined

The system will dynamically stable with A1 = 0

✅ The system will dynamically unstable with A1 = 0 and A2 >0

Miss Mehwish: 03171491481

Question # 5:

Which of the following is the correct option for the dynamic stability of equation; Yt = Abt if value of A = -2 ?

The time path is independent from this value

The time path will be the original time path

The definite solution will be undefined

✅ The time path will be a mirror image of original time path

Question # 7:

Which of the following is the incorrect option for the equation; y'' + 2y' +3y = 2t2+3t+2 ?

All of the given options

There is no value for the complementary solution

The particular solution will be a constant value

✅ The value of particular solution cannot be calculated

Question # 8:

Which of the following is the correct option for the dynamic stability of Phillips equation; d2π/dt2+βk(dπ/dt)−j(g−1)(dπ/dt)+jβkm=jβkm considering complex roots ?

The system will be dynamically unstable when complex roots are negative

✅ The system will be dynamically stable when complex root (h) is negative

The system will be dynamically stable when distinct real roots are negative

The system will be dynamically unstable when repeated real roots are negative

Question # 10:

Which of the following is the incorrect option for the terms of price equation (dp/dt+d2p/dt2) ?

Miss Mehwish: 03171491481

It is rate of change in price over time

It is market price of goods over time

It is slope of rate of change in price over time

☑ All of the given options

Subject Code: ECO607 - Mathematical Economics II

Question # 2: Which of the following is the incorrect option for the possible cases of Phillips equation $d\pi/dt = j\ (p - \pi)$?

- j >< 0
- j = 0
- j > 0
- j > 1 ☑

Question # 4: Which of the following is the correct option for the Phillips equation $p= \alpha- \beta U - T$?

- Unemployment and inflation are inversely related
- All of the given options ☑
- Inflation will decrease when productivity (T) increases
- Inflation will increase when unemployment increase

Question # 6: Which of the following is the correct option for second order differential equation with constant coefficient and variable terms i.e L.H.S is the f(t)?

- The value of particular solution cannot be calculated
- It will change the particular solution
- It will change the complementary solution
- It will change both complementary and particular solution ☑

Miss Mehwish: 03171491481

Question # 9: Which of the following is the correct option for the term Adapted Phillips relation?

- Rate of growth of money wage and rate of unemployment ✅
- Average growth rate of money supply
- Rate of growth of money supply and GDP growth
- None of the given options

Question 1:
Which of the following is the incorrect option for the equation, dydt + u(t).y = w(t)?

- It is first order second degree differential equation
- It is first order differential equation with variable term and variable coefficient
- None of the given options
- ✓ The value of the equation will depend on time

Question 2:
Which of the following is the correct option for the fuel (in litre) equation F'((x) = -0.03F(x) -18?

- ✓ The value of 18 will ensure convergence towards equilibrium value
- The value of 18 is not involved in convergence mechanism of the equation
- The value of 0.03 will lead to divergence from equilibrium value
- Time path is not involved in the equation

Question 3:
Which of the following is the incorrect option for the dynamic time path of the money market, P(t) = [P(0) - Ms/αY] e-(αjY)t + Ms/αY?

- ✓ The particular solution is equal to P(0)
- The deviation will converge towards particular solution if αj>0
- There is a particular solution to the equation

Note: Live quiz MCQs also repeated in Exam (6, 7)

Miss Mehwish: 03171491481

- There is a complementary solution to the equation

Question 4:
Which of the following is the correct option for dynamic stability in the pollution function given by P(t) = 10e-0.2t?

- ✓ The time path should converge towards the zero
- The time path should converge towards the complementary solution
- The time path should diverge from 10
- The time path should be equal to 10

Question 5:
Which of the following is the correct option for the dynamic stability of the time-path of i(t) = [i(0)−(α+γβ+δ)]eβ+δρ−σt+α+γβ+δ?

- ✓ The complementary function will converge to particular solution
- The complimentary function will not converge to particular solution
- The particular function will converge to complementary solution
- None of the given options

Question 6:
Which of the following is the correct option for y''(t) + y' + 3y = 18?

- The particular solution will be equal to 6
- It is a non homogeneous first order differential equation
- ✓ The particular solution will be equal to 18
- It is a homogeneous second order differential equation

Question 7:
Given the equation for rate of consumption dCdt = -4C + 10, which of the following is the incorrect option?

MAM MEHWISH 03184148783

Note: Live quiz MCQs also repeated in Exam (6, 7)

Miss Mehwish: 03171491481

- It is a case of non homogeneous first order differential equation
- There is a particular solution to the equation
- All of the given options
- ✓ It is a case of homogeneous first order differential equation

---

Question 8:
Which of the following is the correct option for the equation, dQ/dP + 2P = -11?

- First order differential equation is not applicable as Q is independent variable
- ✓ The equation represent a modified form of elasticity of demand
- Integration can be used to find value of Q as dependent variable
- All of the given options

Question 9:
Which of the following is the incorrect option for the oil equation, dV/dt + 0.03V(t) = 18?

- It is first order homogeneous differential equation
- ✓ It has both complementary and particular solutions
- It is first order non homogeneous differential equation
- The value of V(t) depends on time

Question 10:
Which of the following is the correct option for the consumption function, C = α + βY?

- ✓ All of the given options
- It has autonomous consumption α
- Consumption is positively related with income (Y)
- β is the marginal propensity of consumption
