Early in design, developers want to meet informally to get feed back on idea about user's need and liking..This evaluation is called_____.
Answer (Please select your correct option)
Quick and dirty
"Quick and dirty" evaluation
A "quick and dirty" evaluation is a common practice in which designers informally get feedback from users or consultants to confirm that their ideas are in line with users" needs and are liked. "Quick and dirty" evaluations can be done at any stage and the emphasis is on fast input rather than carefully documented findings. For example, early in design developers may meet informally with users to get feedback on ideas for a new product (Hughes el al., 1994). At later stages similar meetings

During _____ usage and workflow patterns discovered through analysis of the field research and interviews are synthesized into domain and user models.
Answer (Please select your correct option)
Research
Modeling
Modeling
During the modeling phase, usage and workflow patterns discovered through analysis of the field research and interviews are synthesized into domain and user models. Domain models can include information flow and workflow diagrams. User models, or personas,are detailed composite user archetypes that represent distinct groupings of behavior patterns, goals, and motivations observed and identified during the research phase.

What are "About boxes" and why they are used?
Answer (Please click here to Add Answer)
100%
Normal
Arial
12
The About box is a single dialog box that — by convention — identifies the program to the user. The About box is also used as the program's credit screen, identifying the people who created it. Ironically, the About box rarely tells the user much about the program. On the Macintosh, the About box can be summoned from the top of the Apple pop-up menu. In Windows, it is almost always found at the bottom of the Help menu.

Question No : 45 of 52 **Marks: 3 (Budgeted Time 6 Min)**

Suppose you have designed a software. You choose the participant from group who are the indented users of this software product to test this product. What do you think these participants are the real users in context of usability testing? Briefly explain it.

pg 271 nd lect is 31

Answer (Please click here to Add Answer)

100%

Normal Arial 12 B I U

The people who come to test the product must be members of the group of people who now use or who will use the product. A test that uses programmers when the product is intended for legal secretaries is not a usability test.
The quality assurance people who conduct function tests may also find usability problems, and the problems they find should not be ignored, but they are not conducting a usability test. They are not real users-unless it is a product about function testing. They are acting more like expert reviewers.
If the participants are more experienced than actual users, you may miss problems that will cause the product to fail in the marketplace. If the participants are less experienced than actual users, you may be led to make changes that aren't improvements for the real users.

How customer goals are different from corporate goals with respect to non-user goals?
Answer (Please click here to Add Answer)
100%
Normal
Arial
12
Customer goals
Customers, as already discussed, have different goals than users. The exact nature of these goals varies quite a bit between consumer and enterprise products. Consumer customers are often parents, relatives, or friends who often have concerns about the safety and happiness of the persons for whom they are purchasing the product. Enterprise customers are typically IT managers, and they often have concerns about security, ease of maintenance, and ease of customization.
Corporate goals
Business and other organizations have their own requirements for software, and they are as high level as the personal goals of the individual. "To increase our profit" is pretty fundamental to the broad of directors or the stockholders. The designers use these goals to stay focused on the bigger issues and to avoid getting distracted by tasks or other false goals.

Question No : 50 of 52
Marks: 5 (Budgeted Time 10 Min)
There is a limitation to the interaction between a user and a personal computer. How Wearable Computing removes this limitation? Also discuss the issues with wearable computing.
Answer (Please click here to Add Answer)
100%
Normal
Arial
12
Wearable computers have led to an increase in micro-management. That is, a society characterized by total surveillance and a greater influence of media and technologies. Surveillance has impacted more personal aspects of our daily lives and has been used to punish civilians for seemingly petty crimes. There is a concern that this increased used of cameras has affected more personal and private moments in our lives as a form of social control.

Question No : 51 of 52 Marks: 5 (Budgeted Time 10 Min)

Imagine you are an interface designer in well known software house. While designing an interface what are the important points that you take care keenly with respect to alignment of visual elements?

Alignment; grids, and the user's logical path

Alignment of visual elements is one of the key ways that designers can help users experienced product in an organized, systematic way. Grouped elements should be aligned both horizontally and vertically

In particular, designers should take care to

- **Align labels**. Labels for controls stacked vertically should be aligned with each other; leftjustification is easier for users to scan than right justification, although the latter may look visually cleaner — if the input forms are the same size. (Otherwise, you get a Christmas tree, ragged-edge effect on the left and right.)
- **Align within a set of controls**. A related group of check boxes, radio buttons, or text , fields should be aligned according to a regular grid.
- **Align across controls.** Aligned controls (as described previously) that are grouped together with other aligned controls should all follow the same grid.
- **Follow a regular grid structure** for larger-scale element groups, panes, and screens, as well as for smaller grouping of controls.

Question No : 52 of 52 Marks: 5 (Budgeted Time 10 Min)

Ali is a web designer, he wants to improve the navigation in a US based website "abc.com" that is an electronic commerce company. Ali discusses this issue with his colleague who suggests him to use "Signposts" to improve navigation in "abc.com". Justify with real world example that do really "signposts" help in navigation improvement.

signposts can help users quickly navigate and home in on information they are looking for

Provide signposts

In addition to reducing the number of navigable places, another way to enhance the user's ability to find his way around is by providing better points of reference — signposts. In the same way that sailors navigate by reference to shorelines or stars, users navigate by reference to persistent objects placed in the user interface.

Persistent objects, in a desktop world, always include the program's windows. Each program most likely has a main, top-level window. The salient features of that window are also considered persistent objects: menu bars, toolbars, and other palettes or visual features like status bars and rulers. Generally, each window of the program has a distinctive look that will soon become instantly recognizable.

On the Web, similar rules apply. The best Web applications, such as Amazon.com, make careful use of persistent objects that remain constant throughout the shopping experience, especially the tab bar along the top of the page and the Search and Browse areas on the left of the page. Not only do these areas provide clear navigational options, but their
