SUBJECTIVE PART

BY NIMMA MALIK

What is Transitivity?

In traditional grammar, transitivity was developed as the concept of transitive or intransitive verb (Halliday, 1976) whether the verb takes an object or not, but in SFL it functions to link grammar to the meta functions; however, in Halliday's terms, transitivity as a major component in experiential function of the clause deals with the "transmission of ideas "representing 'processes' or 'experiences': actions, events, processes of consciousness and relations" (1985). It is a semantic system to analyze representations of reality in a linguistic text and create the same experience through various lexico-grammatical options influenced by different mind styles or authorial ideology. (Fowler, 1986).

What is Corpus? Long

A corpus is a collection of spoken or written authentic texts that is representative of a particular area of language use, by virtue of its size and composition. It is not always the case, however, that the corpus is representative of language use in general, or even of a specific language variety, as the data set may be very specialized (such as material collected from the internet) and it may not always be based on samples of complete texts. A corpus is usually computer-readable and able to be accessed with tools such as concordances which are able to find and sort out language patterns. d. A general corpus, also known as a **reference corpus**.

A specialized corpus, as **Hunston (2002) explains is:**

“A corpus of texts of a particular type, such as newspaper editorials, geography textbooks, academic articles in a particular subject, lectures, casual conversations, essays written by students etc. It aims to be representative of a given type of text. It is used to investigate a particular type of language.”

Specialized corpora are required when the research question relates to the use of spoken or written discourse in particular kinds of texts or in particular situations. A specialized corpus might be used, for example, to examine the use of hedges in casual conversation or the ways in which people signal a change in topic in an academic presentation.

Five needed terms before deciding a topic.

A research topic is your general area of interest, whereas the research question is the particular thing you want to find out and which grows out of your research topic (Sunderland 2010). When deciding on a topic, there are a few things that you will need to do:

- ❖ brainstorm for ideas
- ❖ choose a topic that will enable you to read and understand the literature
- ❖ ensure that the topic is manageable and that material is available
- ❖ make a list of key words
- ❖ be flexible
- ❖ define your topic as a focused research question
- ❖ research and read more about your topic
- ❖ formulate a thesis statement

What are the factors of Multimedia discourse analysis?

Multimedia discourse analysis is a field that examines how meaning is constructed and communicated through multimedia, which includes a combination of text, images, sound, and video.

Factors:

- ❖ Discourse analytic
- ❖ Sociolinguistic

❖ Nonlinguistic

Johnstone research project explain.

In her book *Qualitative Methods in Sociolinguistics*, Johnstone (2000) lists a number of criteria that contribute to the development of a good and workable research topic. In her case, she is talking about research in the area of sociolinguistics. What she says, however, applies equally to discourse analysis projects. These criteria include:

- ❖ Ability to get the discourse data that is needed for the research project.
- ❖ A well-focused idea about spoken or written discourse that is expressed as a question or a set of closely related questions;
- ❖ An understanding of how discourse analytic techniques can be used to answer the research question you are asking;
- ❖ An understanding of why your question about spoken or written discourse are important in a wider context; that is, why answering the question will have practical value and/or be of interest to the world at large;
- ❖ Familiarity with and access to the location where your discourse analysis project will be carried out;
- ❖ The time it will realistically take to carry out the discourse analysis project, analyze the results and write up the results of the project;
- ❖ Being comfortable with and competent in the ways of collecting the discourse data required by the project;
- ❖ Being competent in the method of analysis required for the project.

What are kinds of discourse analysis?

- 1) Critical Discourse Analysis (CDA)
- 2) Conversation Analysis (CA)
- 3) Narrative Analysis
- 4) Multimodal Discourse Analysis
- 5) Discursive Psychology
- 6) Pragmatics and Speech Act Theory
- 7) Corpus-Based Discourse Analysis
- 8) Genre Analysis
- 9) Political Discourse Analysis

- 10) Historical Discourse Analysis
- 11) Cognitive Linguistic Discourse Analysis
- 12) Intercultural Discourse Analysis

Differentiate between faster and slower speaker

<u>faster speaker</u>	<u>Slower speaker</u>
1) A faster speaker will generally use fewer intonation units and may be seen as being more urgent, frantic, excited, and anxious. 2) Faster Speaker: Typically produces more words per minute. Their speech can be characterized by a rapid flow of words.	1) A slower speaker may have more intonation units and may be perceived as being more emphatic, determined, and insistent. 2) Slower Speaker: Produces fewer words per minute. Their speech rate is slower, with more pauses and elongated sounds.

What is Interactional Sociolinguistics?

Interactional sociolinguistics (IS) studies the language use of people in face-to-face interaction. It is a theoretical and methodological perspective on language use with eclectic roots in a wide variety of disciplines such as dialectology, ethno methodology, conversation analysis, pragmatics, linguistic anthropology, micro-ethnography and sociology. Basically, IS starts from the finding that, when people talk, they are unable to say explicitly enough everything they mean. As a result, to appreciate what is meant, they cannot simply rely on the words that are used but must also depend on background knowledge, to discover what others assumed the relevant context was for producing words in.

Why is Interactional Sociolinguistics important?

Interactional Sociolinguistics is important because it draws our attention to the existence of subtle cultural differences in the systematic combination of verbal and non-verbal signs which signal contexts and construct meaning, differences that are often hard to pin down by those who use them. IS has thus managed to uncover

meaning and reason behind communicative styles that are regularly identified as inarticulate and incoherent, and the social relevance of this cannot be underestimated.

What is sociolinguistics?

Sociolinguistics is the study of how language varies and changes in social groups. It examines the relationship between language and society, including how language is used in different social contexts and how it reflects and influences social identities, power structures, and cultural norms.

Define phonemes and its examples.

Phonemes are the smallest units of sound in a language that can distinguish one word from another which, when used in the construction of words, produce meaningful contrasts with other words. They are abstract representations of speech sounds and are fundamental in the study of phonology. Each language has its own set of phonemes, which may vary in number and specific sounds. The study of phoneme and their articulation is called segmental level. The units of sounds in a language that differentiate one word from another are called Phoneme.

Examples:

1) English:

- /p/ in "pat" vs. /b/ in "bat"
- /k/ in "cat" vs. /g/ in "gat" (an archaic or non-standard word meaning "gate")
- /i:/ in "beat" vs. /ɪ/ in "bit"
- /s/ in "sip" vs. /z/ in "zip"

2) Spanish:

- /p/ in "papa" vs. /b/ in "baba"
- /e/ in "peso" vs. /i/ in "piso"
- /r/ in "pero" (but) vs. /rr/ in "perro" (dog)

Explain Linguistic anthropology.

Linguistic anthropology is the interdisciplinary study of how language influences social life. It is a branch of anthropology that originated from the endeavor to document endangered languages, and has grown over the past century to

encompass most aspects of language structure and use. As a field of anthropology, linguistic anthropologists are concerned with how language influences culture. This can include how language impacts social interactions, beliefs, cultural identity, and other important aspects of culture.

Linguistic anthropologists have ventured into the study of everyday encounters, language socialization, ritual and political events, scientific discourse, verbal art, language contact and language shift, literacy events, and media. So, unlike linguists, linguistic anthropologists do not look at language alone, language is viewed as interdependent with culture and social structures.

According to Pier Paolo Giglioli in "Language and Social Context," anthropologists study the relation between worldviews, grammatical categories and semantic fields, the influence of speech on socialization and personal relationships, and the interaction of linguistic and social communities. For example, in New Guinea, there is a tribe of indigenous people who speak one language. It is what makes that people unique. It is its "index" language. The tribe may speak other languages from New Guinea, but this unique language gives the tribe its cultural identity.

Linguistic anthropologists may also take an interest in language as it relates to socialization. It can be applied to infancy, childhood, or a foreigner being encultured. The rate of spread of a language and its influence on a society or multiple societies is an important indicator that anthropologists will study. For example, the use of English as an international language can have wide-ranging implications for the world's societies.

What is discursive psychology? And its principles

Discursive psychology is **an approach** that addresses psychological matters in terms of how they figure in discourse in conversations over family mealtimes, in therapy sessions, in witness statements. It begins with psychology, as it confronts people as they live their lives. Discursive psychology is usefully understood as working with three fundamental observations about the nature of discourse. Discourse is:

- ❖ Oriented to action
- ❖ Situated sequentially, institutionally and rhetorically
- ❖ Constructed and constructive

These observations' structure analytic work in DP.

- 1) A central recognition of DP is that actions are **situated**.
- 2) A second major way in which an action is situated is **institutionally**.
- 3) A third major way in which an action is situated is **rhetorically**

What is Text?

In linguistics, the term text refers to:

1. The original words of something written, printed, or spoken, in contrast to a summary or paraphrase.
2. A coherent stretch of language that may be regarded as an object of critical analysis.

Differentiate between Cataphoric and anaphoric references with example.

<u>Anaphoric References</u>	<u>Cataphoric References</u>
An Anaphoric reference occurs when a word or phrase refers to something mentioned earlier in the discourse,	A cataphoric reference occurs when a word or phrase refers to something mentioned later in the discourse.
anaphoric references look back to something previously mentioned	cataphoric references look forward to something that will be mentioned later.
<u>Example:</u> <i>John arrived late because he missed the bus.</i> • Explanation: The pronoun "he" refers back to "John."	<u>Example:</u> <i>When it is ready, dinner will be served.</i> • Explanation: The pronoun "it" refers forward to "dinner."
<i>Mary has a cat. She loves her pet very much.</i>	<i>When he turned around, Hussain saw his friend.</i>

- | | |
|--|---|
| <ul style="list-style-type: none">• Explanation: The pronoun "she" refers back to "Mary." | <ul style="list-style-type: none">• Explanation: The pronoun "he" refers forward to "Hussain." |
|--|---|

What is the relationship between beats and rhythm?

Beats:

A beat is the basic unit of time in music. It is a regular pulse that forms the foundation of a piece of music.

Example:

When you tap your foot to a song, you are typically tapping to the beat.

Rhythm:

Rhythm refers to the pattern of sounds and silences in music. It is the arrangement of notes of different durations over the beats.

Example:

The clapping pattern in "We Will Rock You" by Queen is a simple rhythm.

Relationship between beats and rhythm:

- ❖ While beats are typically steady and unchanging, rhythm can be complex and varied. Musicians use rhythm to create interest, express emotion, and convey the style of the music.
- ❖ Rhythm relies on the beat to provide a structure. Without a beat, the rhythm would have no regular timing to anchor it.
- ❖ When we listen to a stretch of spoken English discourse, we often feel that there is a rhythm or regularity to it, which gives it a characteristic sound, different from other languages and not always well-imitated by foreign learners. The impression of rhythm may arise out of a feeling of alternation between strong and weak 'beats'.

Exophoric and endophoric reference explain

Exophoric reference:

An exophoric reference, or exophora, points to something outside the text. It relies on the surrounding context or situation to understand the reference.

For example:

Words like "this," "that," "there," and "here" are often used in this way.

- 1) If someone says, "Look at that (where "that" refers to something present in the immediate environment but not mentioned in the text).
- 2) "I'll be there in ten minutes." "There" refers to a specific location known to both the sender and the receiver of the message.

Endophoric reference:

An endophoric or endophora reference points to something within the text itself. It relies on the information provided within the text to understand the reference.

Examples:

- 1) John went to the store. He bought some milk.
 - "He" refers to "John."
- 2) Tom and Jerry are friends. They play together often.
 - "They" refers to "Tom and Jerry."
