ENG511 SHORT HANDOUTS MIDTERM

Lesson 01 to 05

(ENG511) Psycholinguistics

EFFORT BY VUHELPERS24 TEAM

REGARDS : SIR ZAHID: 03342743020

Lesson-01

INTRODUCTION TO PSYCHOLINGUISTICS

Topic-001: Introduction to Psycholinguistics

What is psycholinguistics?

Psycholinguistics is the study of how individuals comprehend, produce, and acquire language.

What fields contribute to cognitive science?

Cognitive science integrates psychology, linguistics, artificial intelligence, neuroscience, and philosophy.

What are the main areas of interest in psycholinguistics?

Psycholinguistics focuses on language knowledge, cognitive processes in language use, social rules in language, and brain mechanisms related to language.

When did contemporary interest in psycholinguistics begin?

Contemporary interest in psycholinguistics started in the 1950s, with important precursors in the 20th century.

What is psycholinguistics, and how does it relate to cognitive science?

Psycholinguistics is the study of how individuals comprehend, produce, and acquire language, and it is part of the field of cognitive science. Cognitive science draws insights from psychology, linguistics, artificial intelligence, neuroscience, and philosophy. Psycholinguistics focuses on language knowledge, cognitive processes in language use, social rules in language use, and the brain mechanisms associated with language. Interest in psycholinguistics began in the 1950s, building on earlier work in the 20th century.

Topic-002: The Nature of Language: Psycholinguistics

Why is language important in human society?

Language is crucial in human society because it allows for the organization of a civilized society and is the primary tool for communicating thoughts and feelings.

What are the three primary sets of processes in the psychology of language?

The three primary sets of processes in the psychology of language are language comprehension, language production, and how people use language.

How does language evolve as children grow?

Language evolves from basic communication to serving various functions, including the development of age-specific jargon.

Why is language important in human society, and what does the psychology of language study?

Language is crucial because it enables the organization of a civilized society and serves as a tool for communication. The psychology of language explores mental processes involved in language use, including language comprehension (how we understand speech and written language), language production (how we construct utterances), and how people use language in various contexts.

Topic-003: The Scope of Psycholinguistics

What is cognitive science?

Cognitive science is an interdisciplinary field that combines insights from psychology, linguistics, computer science, neuroscience, and philosophy to study the mind and mental processes.

What makes psycholinguistics an interdisciplinary field?

Psycholinguistics integrates psychology and linguistics, drawing from diverse intellectual traditions.

What is cognitive science, and why is psycholinguistics considered an integration of psychology and linguistics?

Cognitive science is an interdisciplinary field that draws upon insights from psychology, linguistics, computer science, neuroscientists, and philosophy to study the mind and mental processes. Psycholinguistics primarily integrates psychology and linguistics, although it has a rich heritage with contributions from various intellectual traditions.

Topic-004: Language Processes and Linguistic Knowledge

What is the distinction between tacit and explicit knowledge?

Tacit knowledge refers to knowing how to do something without consciously knowing how, while explicit knowledge involves knowing the processes or mechanisms.

What are the four broad areas of language knowledge?

The four areas are semantics (meanings of sentences and words), syntax (grammatical arrangement), phonology (sounds), and pragmatics (social rules).

What are the two main questions in psycholinguistics regarding language?

Psycholinguistics asks, "What knowledge of language is needed for us to use language?" and "What cognitive processes are involved in the ordinary use of language?"

What are the two main questions at the core of psycholinguistic work?

Psycholinguistic work focuses on two primary questions: 1) What knowledge of language is necessary for using language? and 2) What cognitive processes are involved in the ordinary use of language? These questions involve exploring both tacit and explicit knowledge of language and the cognitive processes during language use.

Topic-005: The Historical Context

What were the two periods of interdisciplinary activity in psycholinguistics?

There were two periods: one around the turn of the last century and another in the mid-20th century, separated by decades of behaviorism.

How did the relationship between linguists and psychologists change during these periods?

In the early 20th century, linguists sought insights from psychologists, and in the mid-20th century, psychologists turned to linguists for insights into language.

How can the history of psycholinguistics be divided into two periods, and what were the dominant views during these periods?

The history of psycholinguistics can be divided into two periods of interdisciplinary activity. The first period, around the turn of the last century, was dominated by cognitive views of language, particularly by Wilhelm Wundt. The second period, in the mid-20th century, emerged in response to behaviorist views, with Noam Chomsky challenging these views and emphasizing the role of innate linguistic mechanisms.

Topic-006: Early Psycholinguistics

Who was Wilhelm Wundt, and what was his major contribution to psycholinguistics?

Wilhelm Wundt was a major figure in early scientific psychology, and his major contribution was developing a theory of language production, emphasizing sentences as the core unit of language.

Who played a significant role in the second period of interdisciplinary psycholinguistics?

Noam Chomsky played a powerful role in the second period, challenging behaviorist accounts of language and emphasizing the poverty of stimulus.

How did Noam Chomsky impact the second period of interdisciplinary psycholinguistics?

Noam Chomsky played a significant role in the second period of interdisciplinary psycholinguistics. He criticized behaviorist accounts of language, arguing that they were inadequate. Chomsky's work led to a resurgence in the study of psycholinguistics, with a focus on incorporating linguistic theory into psychological research and examining the role of innate linguistic mechanisms.

Lesson-02

THE CONNECTION BETWEEN PSYCHOLINGUISTICS & NEUROLINGUISTICS

Topic-007: The Information-Processing System

What are the three components of working memory?

The three components of working memory are the central executive, the phonological loop, and the visuo spatial sketchpad.

How is long-term memory divided?

Long-term memory is divided into semantic memory, which holds general knowledge, and episodic memory, which stores personal experiences.

What are the general strategies by which the human mind encodes, stores, and retrieves information independently of language?

The general strategies involve working memory, which temporarily stores information relevant to cognitive tasks, and long-term memory, which is further divided into semantic memory (for general knowledge) and episodic memory (for personal experiences). Studies suggest that distinct brain regions control these memory systems.

Topic-008: Working Memory and Long Term Memory

How many units of information can working memory typically hold?

Working memory can typically hold about seven units of information.

What is the distinction between episodic memory and semantic memory?

Episodic memory deals with personally experienced facts, while semantic memory deals with general facts.

How does working memory handle information, and what are its components?

Working memory can hold about seven units of information, and it uses chunking, where words are grouped into constituents like noun and verb phrases, to manage longer sentences. It consists of the central executive, the phonological loop, and the visuo spatial sketchpad.

What is the distinction between episodic memory and semantic memory in long-term memory?

Episodic memory stores personally experienced facts, while semantic memory contains general facts and knowledge. For example, knowing that John Wilkes Booth killed Abraham Lincoln is part of semantic memory, whereas remembering when and where you first learned this information is episodic memory.

Topic-009: Central Issues in Language Processing

What is serial processing?

Serial processing is when one process is completed before the next one starts.

What is parallel processing?

Parallel processing involves multiple processes occurring at the same time.

What is parallel distributed processing (PDP)?

PDP involves cognitive processes operating simultaneously and influencing each other.

What is the difference between bottom-up and top-down processing?

Bottom-up processing proceeds from the lowest level to the highest level, while top-down processing suggests that higher-level information may influence lower-level processing.

Explain the concept of parallel distributed processing (PDP).

PDP involves cognitive processes occurring simultaneously and independently, with connections between them influencing the final outcome. It's often referred to as Connectionism.

What is the difference between bottom-up and top-down processing?

Bottom-up processing proceeds from the lowest to the highest level of processing, while top-down processing suggests that information at higher levels may influence processing at lower levels, such as context affecting word identification in a sentence.

Topic-010: Examples of Language Processing

What is the key word in the sentence, "I was afraid of Ali's powerful punch"?

The key word is "punch."

Why do most people have a subjective impression of having assumed the wrong meaning in the sentence?

This happens because processing is primarily one meaning at a time, with limited top-down influence.

Analyze the sentence, "I was afraid of Ali's powerful punch," in terms of language processing.

The key word "punch" can have multiple meanings, leading to the subjective impression that one assumed the wrong meaning and then backtracked. Language processing often involves one meaning at a time, with limited top-down processing. However, retrieving multiple meanings is a fixed property of the lexicon, not always related to sentence context.

Topic-011: Development of Processing System Stage 1: Input

What happens during Stage 1 of the processing system?

During Stage 1, the brain is exposed to a stimulus and analyzes and evaluates the information.

Describe the stages of the processing system, with a focus on Stage 1: Input.
In Stage 1, the brain is exposed to a stimulus, where it analyzes and evaluates information. For instance, an online learner reads a passage and decides whether it's worth remembering.

Topic-012: Developing Working and Long Term Memory

Question: How can working memory deal with more than seven words?
Working memory can chunk words into grammatical constituents, reducing the storage burden.

What does semantic memory contain information about?
Semantic memory contains information on the speech sounds and words retrieved during pattern recognition.

What is episodic memory in the context of processing a sentence?
Episodic memory involves extracting the gist of a sentence and storing it once processing is complete.

How does working memory manage information, and what is the role of long-term memory in language processing?
Working memory can hold about seven units of information and uses chunking to handle longer sentences. Long-term memory plays several roles, including storing information on speech sounds and words retrieved during pattern recognition. Additionally, it builds episodic memory representations of ongoing discourse, allowing for the extraction and storage of the gist of a given sentence.

Lesson-03

LANGUAGE COMPREHENSION

Topic-013: Perception of Language

What factors contribute to speech perception in infants?
Speech perception in infants results from a combination of innate preparation (nature) and sensitivity to experience (nurture).

How does the environment influence an infant's language acquisition?

The language an infant listens to during the first year of life enables them to begin producing a distinct set of sounds specific to the language spoken by their parents.

What are "Bottom-up" and "Top-down" processes in speech perception?

In "Bottom-up" processing, auditory information is converted into a neural signal and processed for phonetic features. In "Top-down" processing, stored information about language and the world is used to understand speech.

When does perception occur in speech?

Perception occurs when both "Bottom-up" and "Top-down" processes interact to make one alternative plausible to the listener, who then perceives a specific message.

What factors contribute to speech perception in infants?

Speech perception in infants is the result of a combination of innate preparation (nature) and sensitivity to experience (nurture). Research has shown that infants respond to speech signals in a special way, suggesting a strong innate component to language. Additionally, the language an infant is exposed to during their first year of life enables them to produce a distinct set of sounds specific to the language spoken by their parents. "The Native Language Magnet (NLM)" and "Bottom-up" and "Top-down" processes are also utilized in understanding speech.

Topic-014: The Structure of Speech

Why is the process of speech perception complex for listeners?

The process is complex because the speech signal often competes with other environmental stimuli, which can interfere with the fidelity of the speech signal.

Why is the process of speech perception considered complex?

The process of speech perception is complex due to two major reasons. First, the environmental context often interferes with the speech signal. Under normal listening conditions, speech competes with other stimuli for our limited processing capacity, including other auditory signals like conversations across the room or other background noises.

Topic-015: Perception of Isolated Speech Segments

What attributes are used to represent the speech signal at the auditory level?

The speech signal is represented in terms of its frequency, intensity, and temporal attributes.

How are individual phones identified at the phonetic level?

Individual phones are identified at the phonetic level by a combination of acoustic cues such as formant transitions.

What are the levels of representation in speech perception?

Speech perception involves three levels of representation. At the auditory level, the signal is represented in terms of its frequency, intensity, and temporal attributes. At the phonetic level, individual phones are identified using a combination of acoustic cues like formant transitions. At the phonological level, phonetic segments are converted into phonemes, and phonological rules are applied to the sound sequence.

Topic-016: The Motor Theory of Speech Perception

What is the main idea behind the Motor Theory of Speech Perception?

The Motor Theory suggests that perception of speech is aided by implicit articulatory knowledge about how sounds are produced.

How does the Motor Theory address the relationship between acoustic structure and perception?

It argues that although the relationship between acoustic structure and perception is complex, sounds are produced and perceived in similar ways, despite varying acoustic representations.

What is the main idea behind the Motor Theory of Speech Perception?

The Motor Theory of Speech Perception, developed by Liberman and his colleagues, posits that perception proceeds "by reference" to production. Listeners use implicit articulatory knowledge, which is knowledge about how sounds are produced, to aid in their perception of speech. This theory is based on the idea that although the relationship between acoustic structure and perception is complex, sounds are produced in similar ways but with varying acoustic representations and are perceived in similar ways.

Topic-017: Perception of Continuous Speech

How do prosodic factors influence word recognition in continuous speech?

Prosodic factors such as stress and intonational patterns can influence word recognition in continuous speech.

What factors are at play in the perception of words in continuous speech?

Word recognition is influenced by identifying constituent phonemes and considering the larger word, sentence, or discourse context.

Question: How does prosody influence word recognition in continuous speech?
Answer: The perception of continuous speech shows that word recognition is influenced by prosodic factors such as stress and intonational patterns. These prosodic cues play a significant role in identifying words within the larger context of continuous speech.

Topic-018: Perception of Written Language

What are the three levels at which written language is processed?
Written language is processed at the feature level, letter level, and word level.

How is written language represented at the feature level?
At the feature level, written language is represented in terms of the physical features that comprise a letter of the alphabet.

What happens at the letter level of written language processing?
At the letter level, the visual stimulus is represented more abstractly as an identity separate from its physical manifestation.

When does written language reach the word level of processing?
Written language reaches the word level of processing when an array of features and letters is recognized as a familiar word, making its properties like spelling, pronunciation, and meaning available.

Question: What are the three levels at which written language is processed?
Written language is processed at three levels: the feature level, the letter level, and the word level. At the feature level, the stimulus is represented in terms of the physical features that make up a letter. At the letter level, the visual stimulus is represented more abstractly as an identity separate from its physical form. Finally, at the word level, an array of features and letters is recognized as a familiar word, leading to the availability of properties such as spelling, pronunciation, and meaning.

Lesson-04

DIMENSIONS OF WORD KNOWLEDGE

Topic 019: Phonological Knowledge

What is phonological knowledge?

Phonological knowledge refers to our understanding of the pronunciation or sound structure of words.

Can you explain the "tip-of-the-tongue" (TOT) phenomenon?

The TOT phenomenon is when we can't recall a specific word but remember how it sounds or feels, and it has been described as an active gap in consciousness.

Give an example of homophones.

"Bare" and "bear" are homophones; they sound the same but are spelled differently.

How does the TOT phenomenon relate to speech errors?

During the TOT state, we sometimes substitute similar-sounding words for the intended word, which can lead to speech errors.

Who systematically studied the TOT phenomenon, and what did their research involve?

Brown and McNeill systematically studied the TOT phenomenon. They presented definitions of infrequent words and asked subjects to produce the defined word. When subjects were in a TOT state, they retrieved but rejected similar-sounding words. This research helped understand the nature of word retrieval and the role of phonological knowledge in it.

Topic 020: Phonological Knowledge: Conceptual and Empirical Issues

What are the four main views concerning phonological knowledge?

The four views are (a) Isolative, (b) Functional, (c) Formal, and (d) Integrational or Unified.

How does the Isolative view differ from the Functional view?

The Isolative view considers phonology as separate from the language core, while the Functional view grounds phonology in the sensorimotor apparatus.

Who supports the Formal view of phonology?

Hale and Reiss represent the Formal view, and it is supported by research on sign language phonology.

What is the focus of the Unified view of phonology?

The Unified view considers phonology as a laboratory science and advocates for scientific methodology in testing formal claims.

Question: What are the four main views concerning the nature of phonological knowledge in linguistics, and what are their key differences?

Answer: The four main views are Isolative, Functional, Formal, and Integrational. Isolative views phonology as different from the rest of the language faculty. Functional views it as grounded in the sensorimotor apparatus. Formal views it as similar to the rest of the language faculty and grounded in the mind. Integrational views phonology as a laboratory science, advocating scientific methodology to test formal claims. These views have different perspectives on the relationship between phonological knowledge and linguistic knowledge.

Topic 021: Syntactic Knowledge

What is syntactic knowledge in relation to words?

Syntactic knowledge pertains to the syntactic category or part of speech to which words belong, allowing them to substitute for one another in sentences.

What are the two main categories of words based on their syntactic properties?

Open-class words (nouns, verbs, adjectives, adverbs) and closed-class words (determiners, pronouns, prepositions, conjunctions, interjections).

How do open-class and closed-class words differ in number and use?

Open-class words are numerous and continue to grow, while closed-class words are limited in number and are used repeatedly.

What is agrammatism, and how does it relate to closed-class words?

Agrammatic patients often omit closed-class words in their sentences while preserving open-class words better, suggesting different processing for these word categories.

What is a syntactic category, and how does it relate to word knowledge?

A syntactic category, or part of speech, determines how words can function in sentences. Words in the same syntactic category can substitute for each other in a sentence. Syntactic categories are essential for understanding grammatical rules and are an integral part of word knowledge.

How do open-class words and closed-class words differ in terms of syntactic knowledge?

Open-class words include nouns, verbs, adjectives, and adverbs, and their number can grow. Closed-class words include determiners, pronouns, prepositions, conjunctions, and interjections, and their number is relatively small. Open-class words are more varied and numerous, while closed-class words are used repeatedly and serve as function words in sentences.

Topic 022: Children's Acquisition of Syntactic Knowledge

What are the two main approaches to language acquisition?

The generative approach (Universal Grammar) and the usage-based constructivist approach.

How does the generative approach view language acquisition?

It assumes children have innate linguistic knowledge and can access structural representations without experience.

What is the core difference between the generative and usage-based approaches?

The nature vs. nurture controversy: whether language acquisition is guided by innate knowledge or entirely learned through experience.

What is considered essential for language acquisition in both approaches?

Exposure to language and interaction with speakers in a language community (positive input).

What are the two main approaches to understanding language acquisition in children, and how do they differ?

The two approaches are the generative approach (Universal Grammar) and the usage-based account. The generative approach assumes children have innate linguistic knowledge, while the usage-based account posits that children learn language and syntax through experience and positive input alone. These approaches differ in their views on innate knowledge and the role of experience in language acquisition.

Topic 023: Morphological Knowledge

What are morphemes, and what is their significance in language?

Morphemes are the smallest units of meaning in language and are crucial for understanding vocabulary and word formation.

Differentiate between free morphemes and bound morphemes.

Free morphemes can stand alone as words, while bound morphemes are attached to free morphemes to create new words.

Provide an example of an inflectional morpheme.

The plural morpheme in "cat/cats" is an example of an inflectional morpheme.

How can vocabulary size be estimated using morphological awareness?

Vocabulary size can be estimated by considering whether a person recognizes words formed by adding morphemes to base words.

Sir Zahid

How does the presence of inflectional and derivational morphemes affect word formation and estimation of vocabulary size?

Answer: Inflectional morphemes, like plural or past tense markers, add grammatical contrasts to words. Derivational morphemes, on the other hand, create new words with changes in meaning and sometimes pronunciation. The order in which these morphemes are applied can affect word formation, and they pose challenges when estimating vocabulary size.

Topic 024: Evaluating the Effectiveness of a Morphological Awareness Intervention

What is the first step in a morphological awareness intervention?

The intervention should start with an introduction to the concept of morphology, providing examples and emphasizing its importance.

Why is morphological awareness instruction particularly effective for some children?

It's effective for children with speech, language, and literacy deficits because it improves their phonological awareness, morphological awareness, vocabulary, and reading and spelling skills.

How does morphological awareness instruction relate to phonological awareness?

Morphological awareness instruction may improve phonological awareness by linking sound awareness to meaning.

Why is vocabulary instruction based on morphological awareness important?

Vocabulary instruction based on morphological awareness is vital because it helps children recognize relationships between words, thus enhancing vocabulary, phonemic awareness, and reading skills.

How does instruction in morphological awareness impact phonological awareness and vocabulary comprehension?

Morphological awareness instruction can improve phonological awareness by linking phonemes or sounds to meaning. It helps children understand the phonological relationships between words. It also mediates and facilitates vocabulary acquisition, which, in turn, enhances vocabulary comprehension.

Why is explicit vocabulary instruction based on morphological awareness particularly important for children with language and literacy deficits?

Vocabulary is crucial for communication and reading. For children with language and literacy deficits, explicit vocabulary instruction based on morphological awareness can be especially important. It helps them understand the structure of words, leading to improved reading and spelling skills.

Lesson-05

ORGANIZATION OF THE INTERNAL LEXICON

Topic 025: Semantic Knowledge

What is the reference of a word?

The reference of a word is the relationship between words and the things in the world, and the things in the world are referred to as the referents of the word.

Why is reference important in determining the truth of a sentence?

Reference is essential because it helps us determine the truth conditions of a sentence, which are the conditions under which a sentence can be considered true.

Give an example of reference in a sentence.

Example: In the sentence, "There is a brown cow grazing in the field," the reference concerns whether there is a cow, it's brown, and it's grazing in the field.

What are some examples of abstract words that are difficult to determine their reference?

Examples of abstract words with unclear reference include justice, plausibility, and relativity.

List some ways in which meaning is developed.

Meaning is developed through synonymy, hyponymy, meronymy, taxonomic relations, attributive relations, functional relations, denotation, and connotation.

What is the significance of understanding the distinction between sense and reference in the context of word meaning?

The distinction between sense and reference is crucial for grasping the nuances of word meaning. Sense refers to the conceptual understanding or mental image a word

invokes, while reference pertains to the real-world objects or entities the word points to. Understanding this distinction is essential because it underpins our ability to determine the truth of sentences. For example, in the sentence, "There is a brown cow grazing in the field," we must comprehend the sense of words like "brown," "cow," "grazing," and "field" and assess whether they align with the reference in the actual world. Recognizing the interplay between sense and reference is fundamental in various disciplines, including linguistics, philosophy, and psychology, as it sheds light on how we acquire, convey, and interpret meaning in language.

Topic 026: The Concept of a Semantic Network

What is a semantic network?

A semantic network is a graphical representation used to convey and organize knowledge through interconnected nodes and arcs.

How are semantic networks used?

Semantic networks can be used to represent knowledge or support automated systems for reasoning about knowledge.

What is the purpose of a definitional network in a semantic network?

Definitional networks emphasize the subtype or is-a relation between concept types and subtypes, supporting inheritance of properties from super types to subtypes.

Topic 027: Hierarchical Network Models

What is the hierarchical network model in the context of a semantic network?

In the hierarchical network model, knowledge of words is organized in a hierarchical structure, with some words represented at higher nodes than others.

Topic 028: Spreading Activation Models

How do spreading activation models differ from hierarchical models?

Spreading activation models are not strictly hierarchical; they involve the spread of activation from one node to neighboring nodes and incorporate various types of knowledge, such as conceptual, syntactic, and phonological.

Topic 029: Advantages and Disadvantages of Semantic Differential Scale

What is Osgood's Semantic Differential scale used to measure?

Osgood's Semantic Differential scale is used to measure the semantics or meaning of words, especially adjectives, and their associated concepts.

What are the three recurring attitudes measured by the Semantic Differential scale?

The three recurring attitudes are evaluation (e.g., good-bad), potency (e.g., strong-weak), and activity (e.g., active-passive).

What is the purpose of Osgood's Semantic Differential scale, and what are the advantages and disadvantages of using this scale to measure the semantics of words and concepts?

Osgood's Semantic Differential scale is designed to measure the semantics or meaning of words and concepts, particularly adjectives, and their associated concepts. This scale serves as a structured tool for evaluating and quantifying the affective and evaluative dimensions of words and phrases. There are several advantages and disadvantages associated with the use of the Semantic Differential scale.

Advantages:

One major advantage is that it offers a structured and controlled way to measure the affective meaning of words, allowing for the quantification of attitudes, opinions, and values. The scale provides a standardized framework for capturing nuances in meaning and distinguishing fine differences in viewpoint. Additionally, through factor analysis of large collections of Semantic Differential scales, Osgood and his colleagues identified three recurring attitudes—evaluation, potency, and activity—that appear to be cross-cultural universals. This insight has contributed to a deeper understanding of affective meaning across languages and cultures.

Disadvantages:

On the downside, the Semantic Differential scale may be limited by the potential bias introduced by the selection of adjective pairs, which might not encompass the full range of meanings and nuances of all words and concepts. Also, its reliance on bipolar pairs of adjectives may oversimplify the complexity of meanings and lack the granularity to capture the full spectrum of affective responses to words. Furthermore, the scale's effectiveness may be context-dependent, and its results can be influenced by cultural and individual differences. Finally, the scale's application may not fully address the intricacies of semantic meaning in specific contexts, where the interpretation of words and concepts can be highly context-dependent.

Topic 030: Semantic Barriers

What is a semantic barrier in communication?

A semantic barrier in communication occurs when the meaning of words, signs, or symbols is interpreted differently by the sender and receiver due to various factors, including language, education, culture, and personal experiences.

Give an example of a factor contributing to a semantic barrier.

Example: Differences in dialect or accent can contribute to a semantic barrier, causing misunderstandings in communication.

What are semantic barriers in communication, and what are the factors contributing to such barriers?

Semantic barriers in communication are obstacles that arise when differences in the meaning of words, signs, or symbols exist between a sender and a receiver, leading to misunderstandings in the communication process. These barriers result from variations in how individuals perceive, interpret.
