IMPORTANT CHAPTER VISE MCQS

NATASHA STUDY ZONE

Objective

Lesson 1

- Bilingualism refers to the state of a **linguistic community**
- Bilinguality is the **psychological** state of an individual who has access to more than one linguistic code as a means of social communication.
- bilingualism range from a native-like competence in **two** languages .
- **Titone (1972)** for whom bilingualism is the individual's capacity to speak a **second** language
- Functions of language are **universal** but the linguistic forms vary across **languages** and **cultures**.
- functional level where all the **meanings** and **intentions** to be **expressed** are **represented**
- formal level at which all the **surface forms** used in the **language** are **represented**.
- Function plays a **strong causal role** in the way adults and acquired by children
- study of language can be conducted at **several levels** of analysis, the nature of language behavior
- There is a constant interaction between the dynamics of language behavior at the **societal level** and language behavior
- Language behavior is the product of **culture** of acculturated behavior.
- **Self-regulation** is a characteristic of all **higher-order behaviors** and therefore of language behavior.
- central to this dynamic interaction between the societal l e v e l and the individual level is **valorization**.
- **two languages** are in contact there can be a state of equilibrium between the two languages
- languages is **constant** and **predictable**.
- This equilibrium is not unlike the one existing in **ecological** systems.
- **two-level** mapping between function and linguistic form is based on the assumption that linguistic forms are developed to express **meanings** and **communicative** intentions.

Lesson 2

NATASHA STUDY ZONE

- **Language** is never static but changes over time.
- **pidginsation** is an example in this regard which is developed for the purpose of minimal communication pidginisation process, limited and simplified linguistic forms are developed.
- individual level, higher-order behavior is **self-regulated.**
- A similar situation happens in the case of multilingual societies.
- One or more languages will be highly valued, while others will be **devalorized**. At the individual level a similar mechanism operates.
- To the extent that the adults around the child value the use of language for certain **functions**.
- language behavior is **dynamic**:
- **Modeling** of language behavior has been developed more at individual level than at **societal** level.
- models are rooted in a larger framework of **psychological theorizing**.
- **Pinker** (**1996**), a comprehensive theory of language acquisition
- social- psychological component and an equally important **cognitive** component.
- **Functions** that language will later serve are developed before the child acquires the linguistic forms. According to **Bruner** (1975a), before developing language the child learns some communicative functions
- context sensitivity and a sense of functions before linguistic forms are **accessed**.
- **communicative** and **cognitive** functions, language has a social function.
- whole social structure is present in every language interaction and that every interaction is mapped onto the **social structure**.
- **Languages** and varieties of language (**accents, dialects, sociolects, and codes**)
- Different **language** varieties and their values are **learned** in particular markets.
- The structures of social networks influence the individual's language **behaviour** and group solidarity can lead to the maintenance of local, non-standard norms,
- When two or more languages are in **contact**, their relative functional use and relative **valorization** is very important.

NATASHA STUDY ZONE

- A change in the use of **two** languages at the societal level,
- introducing a compulsory **language** of **schooling**, will bring about a change in the use of language
- **Language shift** is defined as the change from the use of one language to the use of another language across generations
- language attrition is a shift occurring within one **individual**.
- **functions**, **forms** and language skills.
- The shift is complete when parents of one generation cease to transmit their language to their children and when the latter are no longer motivated to acquire an **active competence** in that language.
- Language behaviour is based on the **five** principles:
- There is a constant interaction between the societal and the **individual dynamics** of language.
- There are complex mapping processes between the form of language **behaviour** and the functions it serves.
- There is a **reciprocal** interaction between culture and language.
- **Self-regulation** characterizes all higher-order behaviours, and therefore language.
- **Valorization** is central to these dynamic interactions.
- **Social** and **psychological** realities are simultaneous
- person is at one and the same time an **individual**,
- member of social networks and groups and part of the **wider** society.
- The multidimensional nature of bilingualism, calls upon an array of disciplines ranging from **neuropsychology** to **developmental** psychology

Lesson 3

- Bilinguality is a **psychological** state of an individual who has access to more than one linguistic code as a means of social communication.
- This access is **multidimensional** as it varies along a number of psychological and sociological dimensions.
- **Balanced** bilinguality: equal proficiency in both languages
- **Dominant** bilinguality: higher proficiency in one language
- **Endogenous** bilinguality: presence of both languages in the community environment
- **Exogenous** bilinguality: absence of the second language in the community

NATASHA STUDY ZONE

- **Acculturated** bilinguality: L membership and cultural identity
- **Deculturated** bilinguality: ambiguous membership and anomic identity

Lesson 4

- language contact' takes place when we speak of '**language contact'**
- Sociolinguists have shown how **monolingual** behaviour varies according to a number of parameters
- The bilingual community is either composed of **two** groups speaking two different languages as their mother tongue
- languages may be an official language of the **community**.
- Every bilingual community is situated between the **two** poles of a **continuum**
- territory with the two (or more) languages having **official** status in their own territory
- territorial bilingualism include **Belgium**, **Canada** and **India**.
- colonial past or a **local** language.
- **Monolinguality** is more commonly found in economically dominant groups whereas the members of minority or subordinate groups tend to be **bilingual** or **multilingual**.
- **Minority** does not necessarily imply numerical inferiority, but refers rather to a subordinate status in the community.
- subordinate group can use its numerical superiority to impose its own language norms through language-**planning legislation**
- Groups may speak to each other in their respective **languages**; or may understand it but not speak it.

NATASHA STUDY ZONE

Lesson 5

- Bilingualism must be approached as a **complex** phenomenon which simultaneously implies a state of bilinguality of individuals and a state of languages

- Comparative measures: most frequently used **technique** for measuring the various dimensions of bilinguality consists in taking measures in each of the bilingual's **two** languages
- native speaker's competence in that language is, which is very difficult to **operationalize**.
- comparative approach is the only valid one when **bilinguality** is measured on the 'additive— subtractive' dimension.
- comparison is made between cognitive measures obtained for **bilinguals** and **monolinguals**.

Measures of Compound—Coordinate Bilinguality

- the compound and coordinate bilingual is one of **semantic** representations
- it implies that for the **coordinate** bilingual,
- there is a greater semantic independence between **his two linguistic codes,** while for the compound
- there is greater semantic interdependence between the **two** codes.

Measures of Bilingual Specificity

- Translation and verbal flexibility are only measures in which the **bilingual's behaviour** is viewed as the sum of **two** monolingual behaviours.
- A bilingual also develops patterns of **behaviour** that are unique to his state of bilinguality
- There is an attempt to correlate the degree of balance of bilinguals with a high level of competence in rule-governed **code-switching.**

Measures of Cognitive Correlates of Bilinguality

- **cognitive advantage** or a cognitive disadvantage of bilingual development as compared to monolingual development
- concepts of cognitive advantage and disadvantage are defined by reference to **monolinguals**.

Measures of Affective Correlates of Bilinguality

- There is always a **cognitive** and an **affective** aspect to development.
- The affective component of **bilingual development** has to do with the relationships between the bilingual individual and his **two** languages.

NATASHA STUDY ZONE

- language is a social phenomenon all affective reactions towards it are not limited to the language but applies also to the individuals and groups who speak that **language**.

- **Measurement of Bilinguality in Cultural Minorities**
- The measures of **bilinguality** previously mentioned are not applicable to all situations of languages in contact.
