ZOO506

APPLIED ENTOMOLOGY AND PEST MANAGEMENT

Date. 2

Name :- Liaqat Ali

VU ID:- Mc200403701

SEMESTER:- 2nd

CLASS:- Msc Zoology

GROUP:- "C"

DURATION:- 31st May - 19 June 2021

CLASSIFICATION & PEST MANAGEMENT

PRACTICAL 1:-

Field visit for collection of different development stages of insects belonging to different orders.

Basic collecting can be done by catching different insects with your hand or net and putting them in some type of jar.

But for more collecting additional equipment is needed. In our museum, we collect a wide variety of insects by using different methods and traps. I have given a list of many of the insects collecting traps and supplies used by museum

Date. 4

=> COLLECTING SUPPLIES FOR TERRESTRIAL INSECTS

Collecting bag or other container

Insect nets

collecting jars.

Envelops

Forceps

Beat sheet

Aspirator

Bait

Repellent.

PRACTICAL 2:-

Identification and Calasification of collected specimen.

The Identification of insect species is largly a process of patient observation, simply by paying attention to key elements will help you determine what is what?

=> STUDYING SPECIMEN:-

While a good quality 10 x lens will reveal a surprizing amount of detail, a binacular stereo microscope is recommended for every one wishing to study insects.

An appropriate binacular will provide magnification from 10 x to 120 mm. with a good lamp giving a cool bright light.

Date. 7

APPLIED ENTOMOLOGY

PRACTICAL 4:-

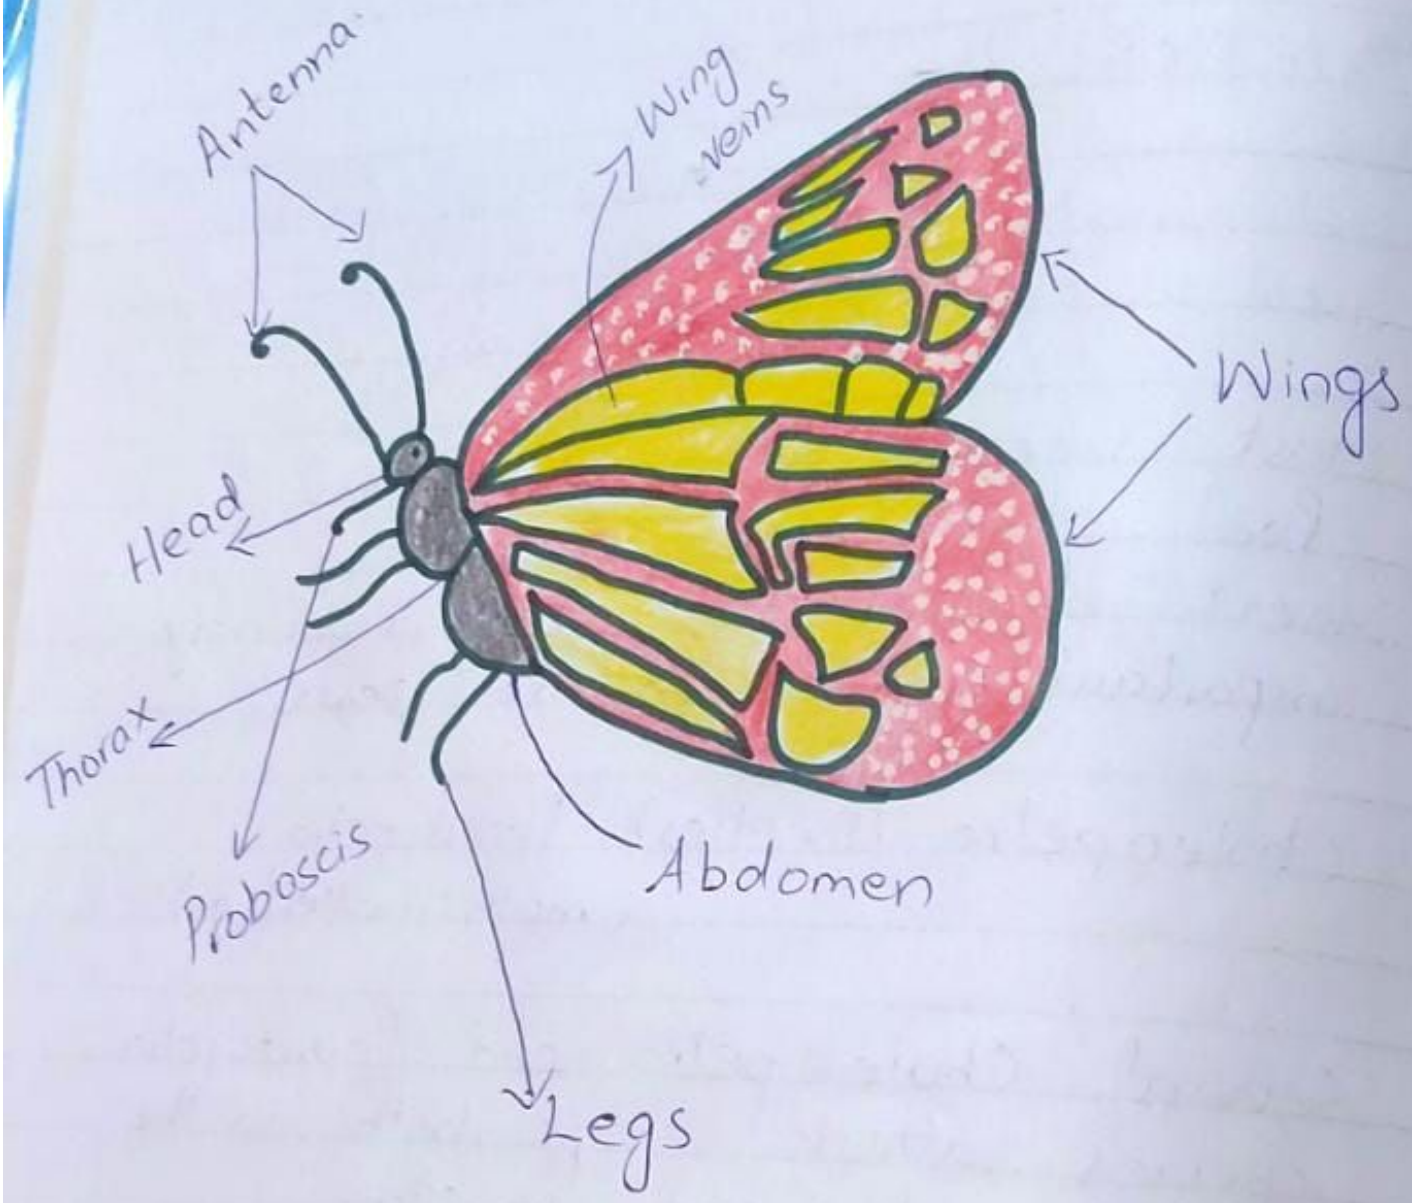

Collection, identification and mode of damage of insect pest of various crops.

Most insect pests of stored food, two major groups of insect harbor the mostly economically important post harvest pests.

Choleopetra, (Beetles) lepidopetra (moths, butterflies)

Several Choleopetra and lepidopetra species attack crops both in the field of and in store.

Butterflies and moths play and important role in natural ecosystem as pollinators and as food in food chain.

PARTS OF BUTTERFLY.

=> BUTTERFLY:-

They belong to the Subphylm Hexapoda or Six legged arthropods. They are in class insecta. The insects.

Finally, all butterflies are in the order lepidopetra which means "scale wing".

They are along with skippers and moths.

=> CLASSIFICATION:-

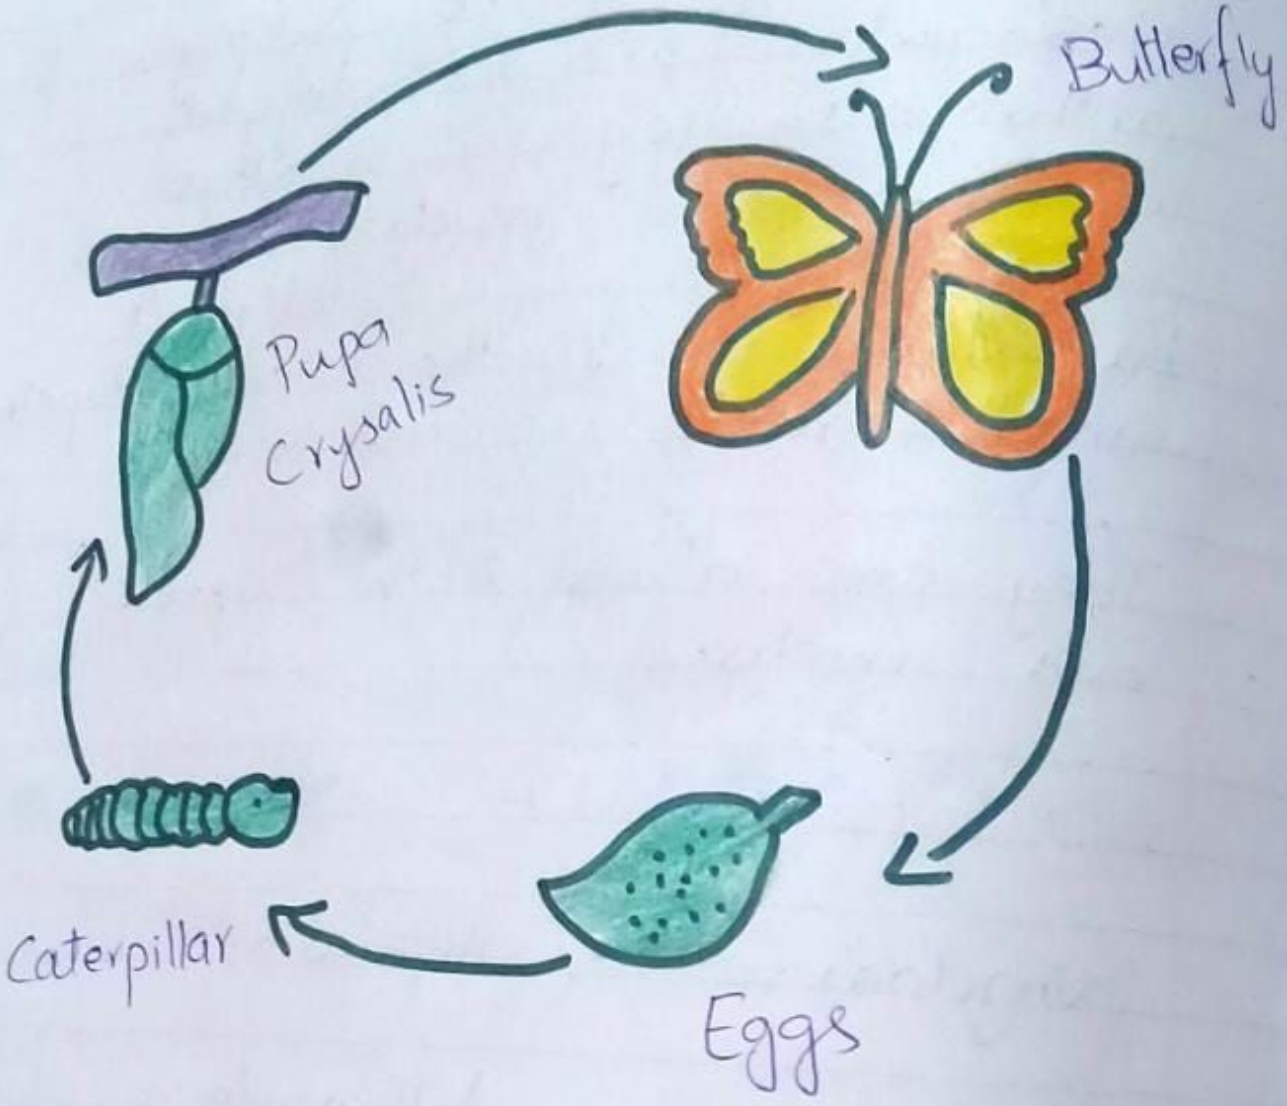

Kingdom :- Animalia

Phylum :- Arthropoda

Class :- Insecta

Order :- Lepidoptera

Sub order :- Rhopalocera.

LIFE CYCLE OF BUTTERFLY.

Date. 11

=> CATTER PILLER:-

These are the larval stages of butterflies. They belong to order Lepidoptera

Moving up all insect belong to class Insecta. This class include all insects, arachnids, myriapods and crustaceans.

Caterpillars of most species are herbivores. but not all some are intersectivores.

Caterpillars are typically voracious feeders and many of them are serious insect pests.

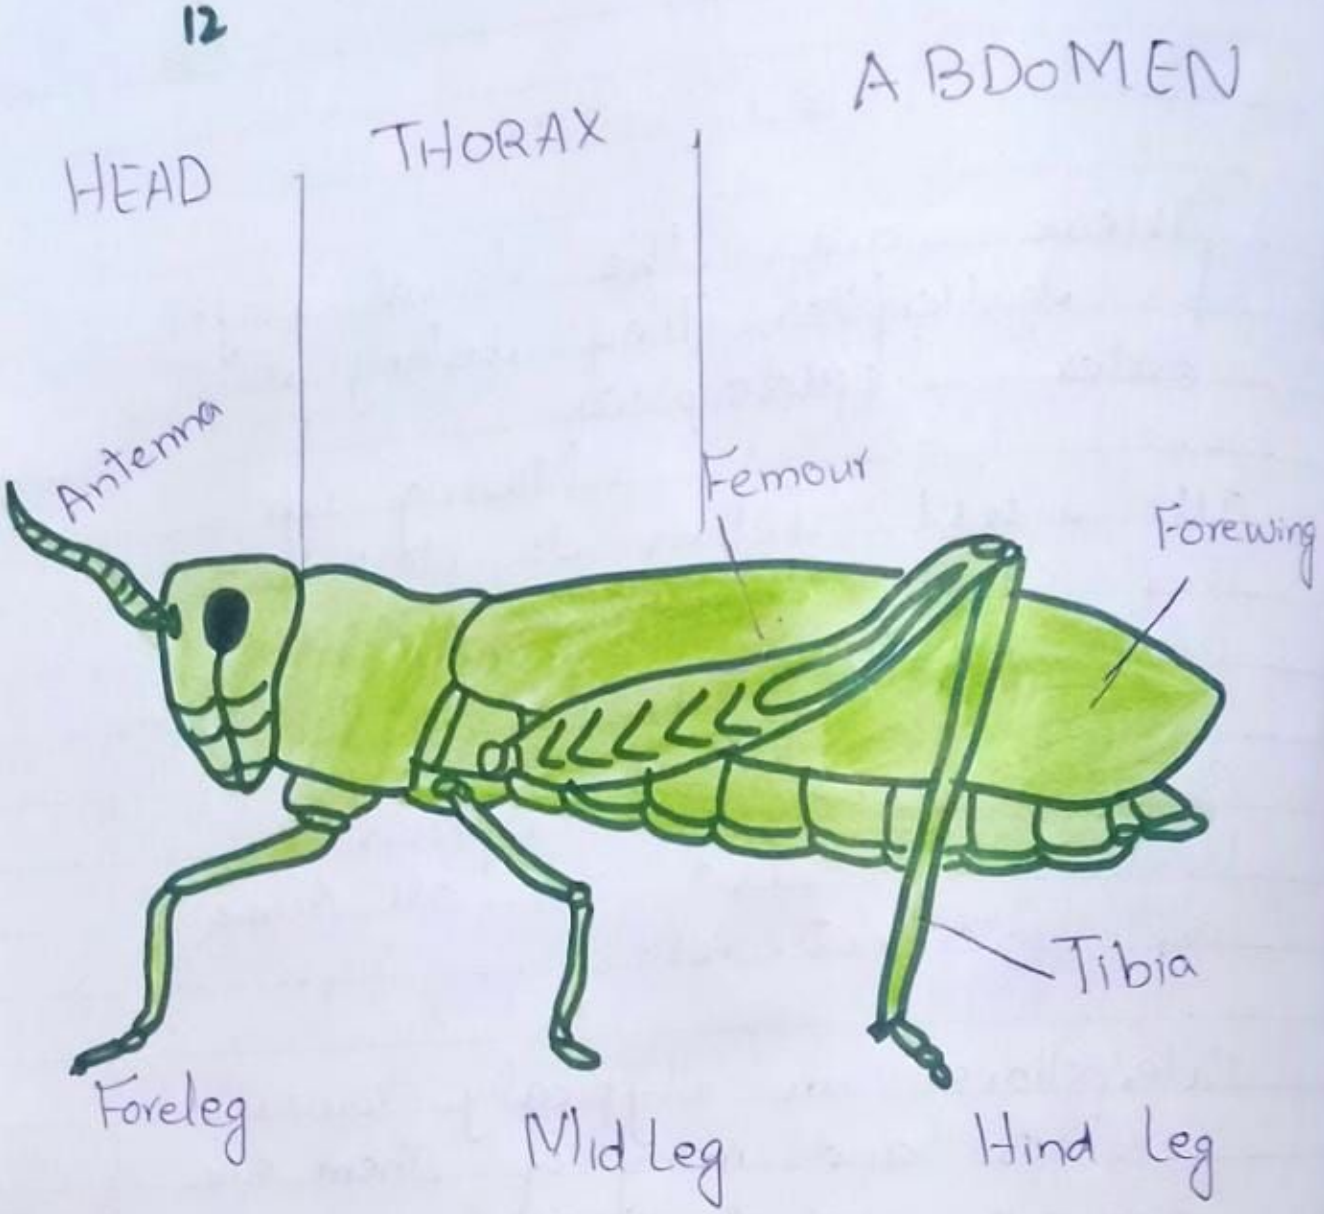

=> CLASSIFICATION:-

Kingdom:- Animalia

Phylum:- Arthropoda

Class:- Insecta.

=> GRASS HOPPER :-

Grass hoppers are group of insects belonging to suborder Chaelifera. They are among what is probably the most ancient living group of chewing herbivores dating back to the early Triassic Around 250 million years ago.

Grasshoppers are typically ground dewelling insects with powerful third legs which allow them to escape from threats by leaping vigorously.

=> CLASSIFICATION :-

Kingdom :- Animalia

Phylum :- Arthropoda

Class :- Insecta

Order :- Orthoptera
