

DISCOURSE AND RELIGION

Religious Language

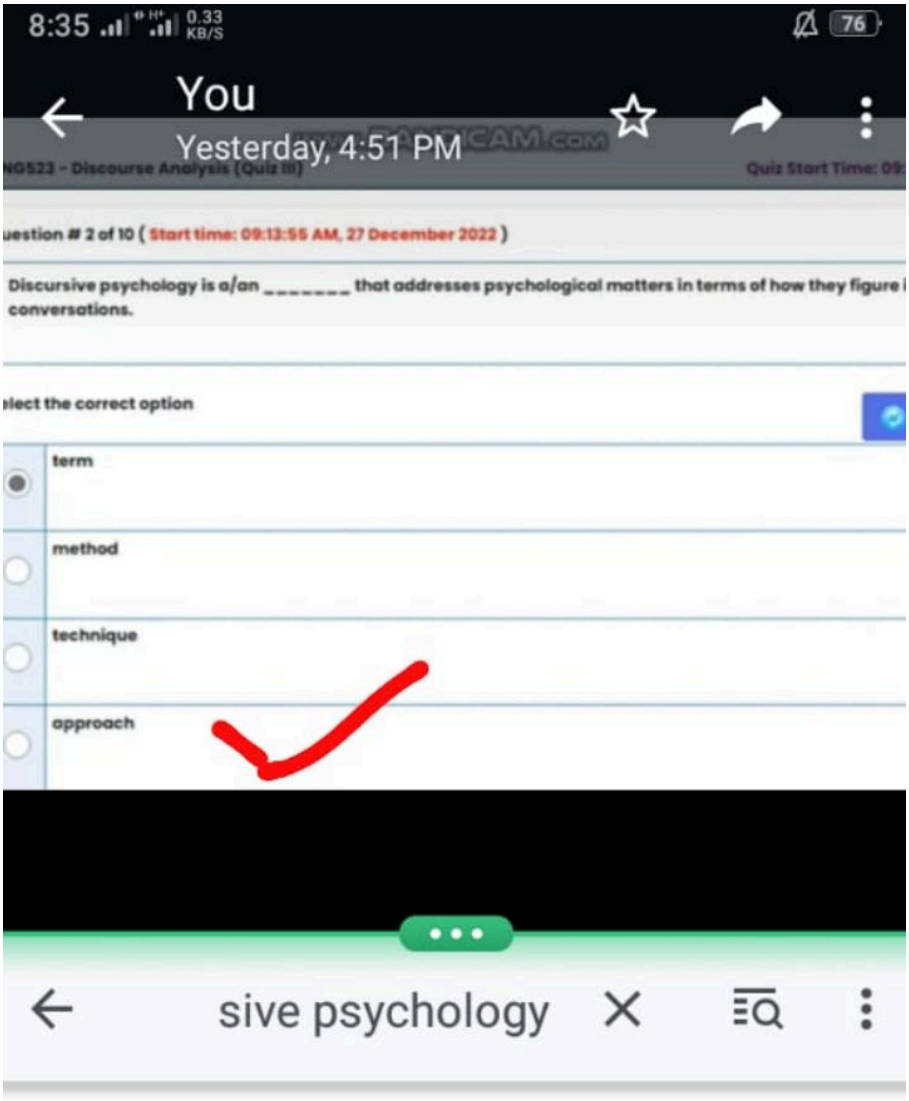

The term "religious language" refers to statements or claims made about God or gods. Here is a typical philosophical problem of religious language. If God is infinite, then words used to describe finite creatures might not adequately describe God. The ambiguity in meaning with respect to the terms predicated of God is the "problem of religious language" or the "problem of naming God." These predications could include divine attributes, properties, or actions.

Religious discourse contains stories, supernatural characters, myth, attractive images and sometimes difficult logic. Therefore, religious texts are filled with metaphor. Metaphors differently interpret the text, "Christ is God and man," The metaphor is constructed to be interpreted in one way rather than another. Relations among words give to fuzziness. Metaphors lead to additional layers of meaning.

Multiplicity of meaning is encoded in the religious texts. Ambiguity is often found in religious texts. The word "God" has many meanings. God is benevolent, or malignant, kind, or cruel, a person or a symbol, etc. Religious contexts can be revealing Ritual speeches as display a degree of repetition mysterious vocabulary, unusual intonation mark the discourse.

John Du Bois (1996) identified some of the features of Religious language:

- Use of rituals
- Archaic elements
- Euphemism and metaphor

DISCURSIVE PSYCHOLOGY AND DISCOURSE ANALYSIS

Principals of Discursive Psychology

Discursive psychology is an approach that addresses psychological matters in terms of ho figure in discourse in conversations over family mealtimes, in therapy sessions, in v statements. It begins with psychology confronts people as they live their lives.

Discursive psychology is usefully understood as working with three fundamental obser about the nature of discourse. Discourse is:

- Oriented to action
- Situated sequentially, institutionally and rhetorically
- Constructed and co

These observations' struc ic work e will take them in turn.

Discourse is action orientation

DP starts with a focus on discourse as a central resource for performing action. These

1. The media texts may throw up discourses and are called _____

a) Binary oppositions

b) Violations

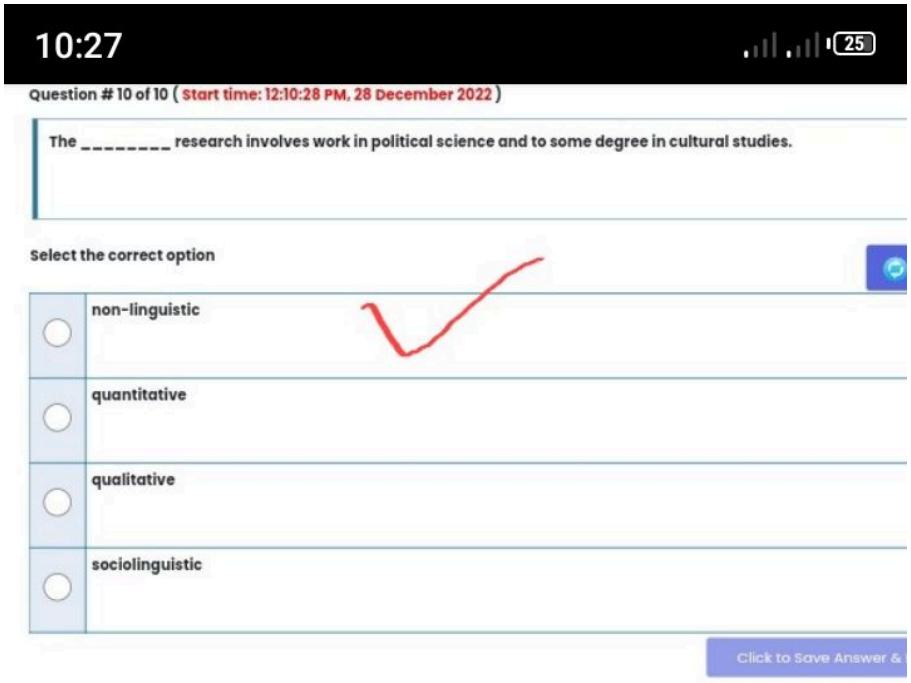

c) Oppositions

d) Media Illiteracy

View Answer

Answer: a

Explanation: Some texts may also throw up discourses and their meanings if you

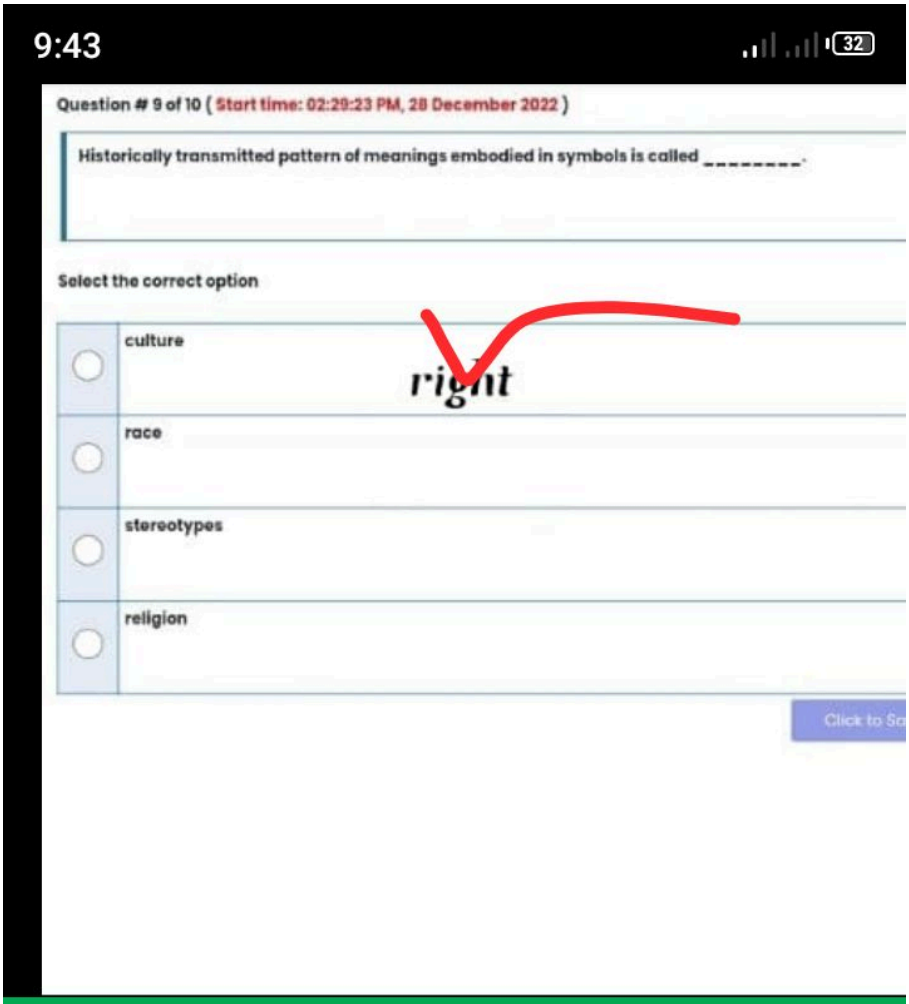

participant, topic, function, and discourse structure, as well as a range of topics that includes news interviews, quotation and reported speech, register issues, politeness, positioning and framing.

The term **"sociolinguistic"** for work that involves variation and style in the media or a similar close analysis of language. Sociolinguistic insights, either to characterize some dimension of media language, such as variation and style, or to inform related discourse level work, such as genre and register. The **"nonlinguistic"** research involves work in political science, media studies, or communication studies paradigms and, to some degree, in cultural studies. Nonlinguistic domains are referred to by media discourse researchers perhaps more than in any other topical area of discourse analysis.

©Copyright Virtual University of Pakistan

Narrative Structure

Journalists write stories, and accordingly, research into story structure or narrative becomes relevant to account for their motivations. Frameworks that have been successfully applied to other domains of talk, such as Labov's (1972) narrative framework have also been applied to news discourse. For example, Bell (1991) uses Labov's framework to examine the global narrative structure of news across local and national news boundaries, while van Dijk (1988)

historically 4 of 5

and Weber. Attempting to trigger off of the great theories of the past Geertz wants to explore the "cultural dimension of religious analysis."

Geertz has to further explain what he means by "culture" and "religion." Culture is defined as "a historically transmitted pattern of meanings embodied in symbols," which is used by humans to "communicate, perpetuate and develop their attitudes toward life." Religion is then defined as a special system of symbols that does four different things. **Religion:**

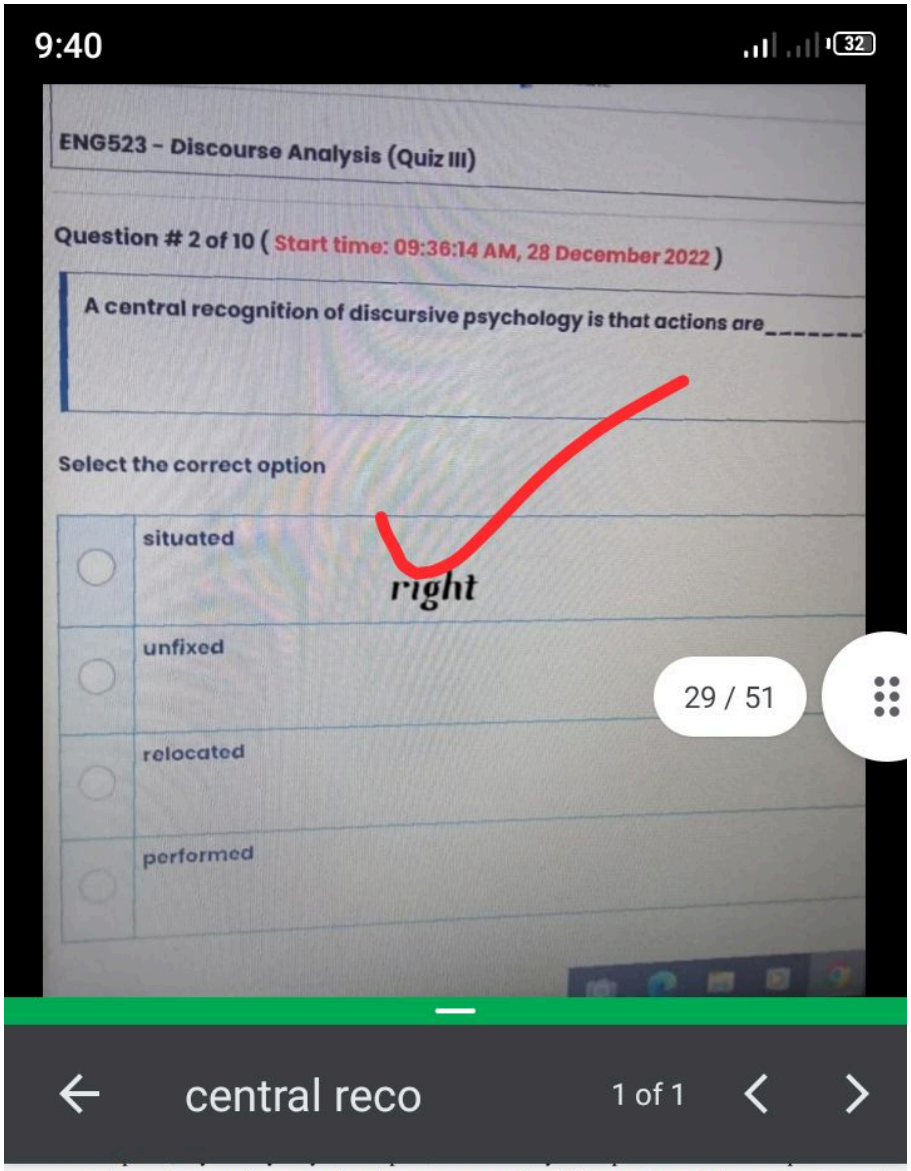

- Establishes powerful "moods and motivations" in people
- Formulates a "general order of existence"
- Makes these "conceptions appear as fact"
- Makes these moods and motivations seem "uniquely realistic"

89 / 193

Discourse and religion exploit the extremes of religious practi… ling… commonplaces and sharpen understandings of general linguistic and semiotic process… Narrowing discourse and religion to the study of the characteristics and peculiarities of discursive practices carries risks, however. We too often take for granted what makes these practices religious, which means that we prematurely delimit our object of study and neglect to explain how these practices come to be seen as 'religious' and for whom they are so seen. It is now well appreciated that we cannot presume the governess of religion as a category (Asad 1983, 1993; Masuzawa 2005; Tambiah 1995) and simply place discursive practices in it, as if their religious provenance were self-evident and left unchallenged by social actors.

This review addresses two major issues. The first is a fundamental problem for religious practitioners themselves, that of how to communicate with agents, such as gods, spirits, and ancestors, who are immaterial. All sorts of discursive resources, from registers to reported speech, are mobilized in an effort to materialize these agents. The second issue is equally fundamental but often neglected by analysts: it concerns the manner in which discourse gets separated out as 'religious' in relation to the secular.

(10) A curiosity of this topic is that the literature is both small – few researchers on discourse would describe what they do as that of "language and religion" or "discourse and religion" – and

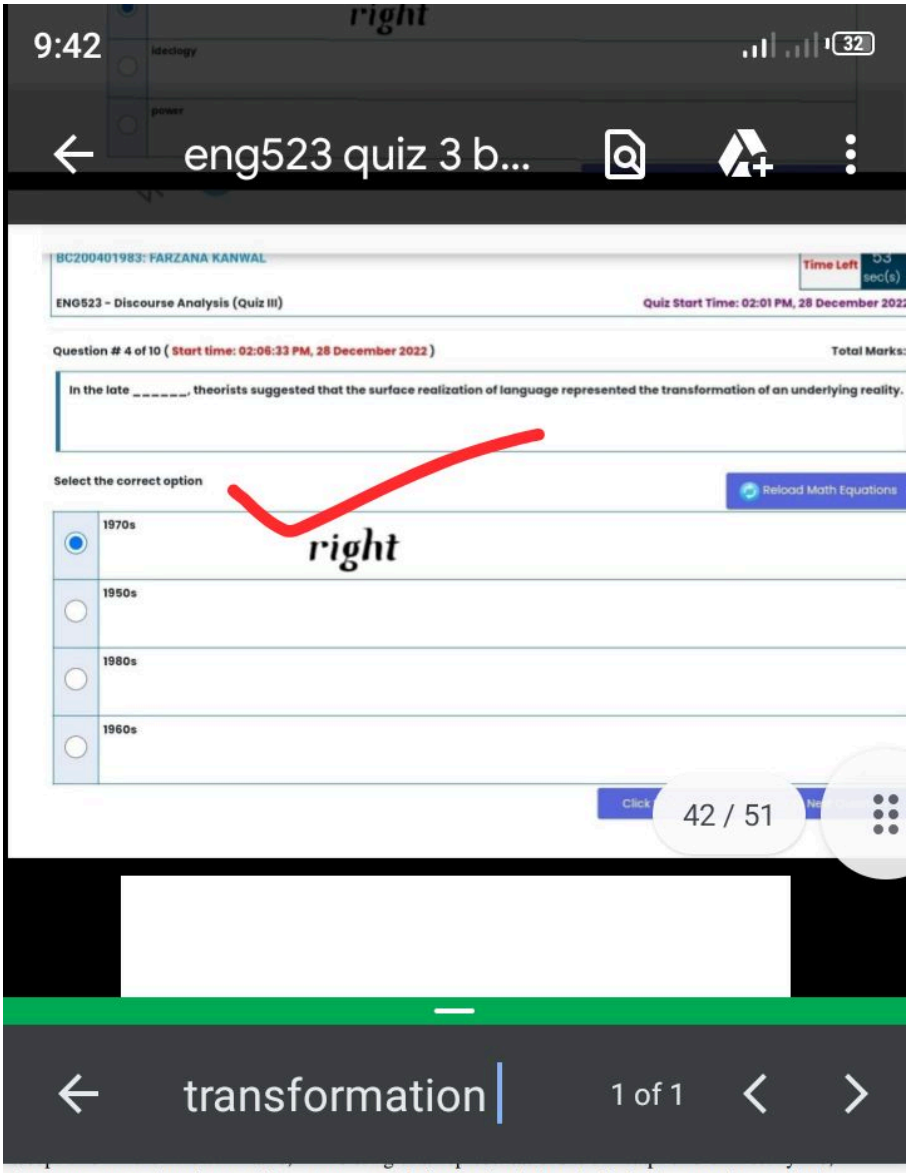

exists using questions to give 'person centered' advice, perhaps. Often actions are done indirectly, via descriptions of some kind that provide a different kind of accountability for the speaker than an 'on-the-record' speech act. The key point is that discourse is studied for how action is done rather than treated as a medium for access to putative mental objects (intentions dislikes). This is a very different start-point from that of cognitive psychology, which was largely born out of an engagement with linguistics, and more specifically out of a concern with grammatical structure and abstract semantics (Potter and te Molder, 2005).

Discourse is situated

A central recognition of DP is that actions are **situated**. The most profound way that action is situated is in terms of the here and now of conversational sequence. Talk is occasioned. This point is at the heart of discursive psychological research practice. When we move from language as an abstract system that has a static and abstract relation to the world and to mental organizations to an action-focused approach, we are immediately considering the way events unfold in real time. A **second** major way in which an action is situated is **institutionally**. DP does not adopt a position of contextual determinism; it does not treat all interaction in a doctor's surgery, say, as intrinsically medical. Nor does it treat institutional talk as organized into coherent, conceptually organized discourses, such that medical settings will implicate a medical discourse or register.

A **third** major way in which an action is situated is **rhetorically**. This came out of the early engagement with Billig's (1996) rhetorical psychology. It highlights the way that descriptions are often organized to counter actual or potential alternatives and organized in ways that manage actual or possible attempts to undermine them (Potter, 1996). A major theme in DP is the way

©Copyright Virtual University of Pakistan

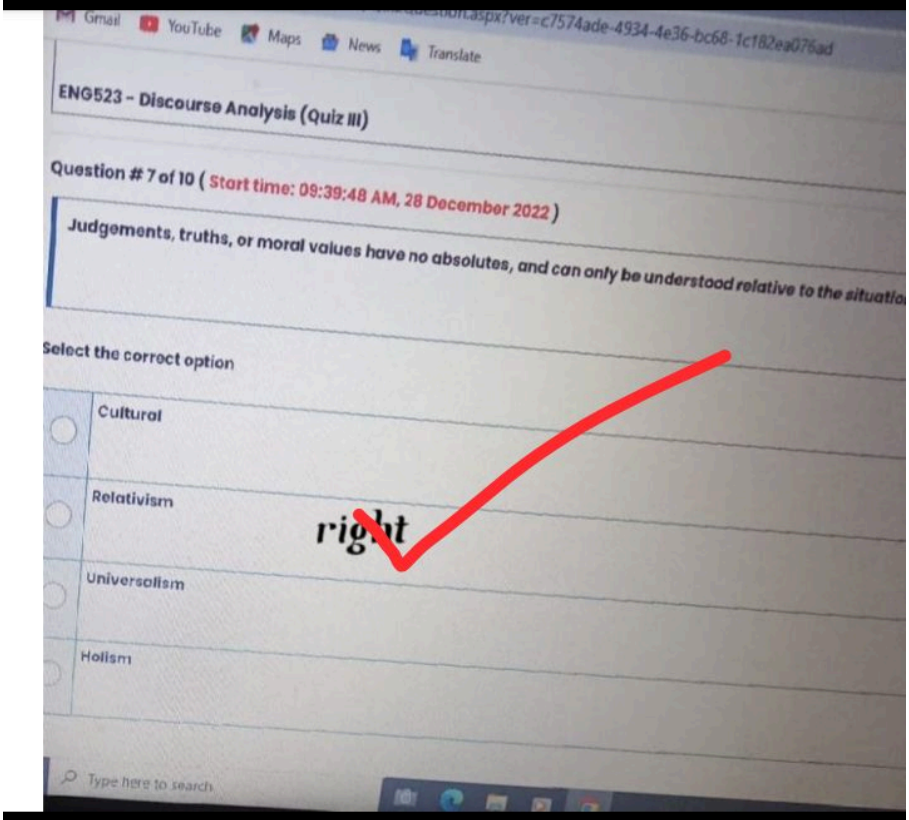

they are contrasting them with a more straightforward relation (called direct understanding). Since the metaphoric relation is not direct, some kind of mapping is necessary. And in fact, much of Lakoof and Johnson and Kovecses (1986) consist in spelling out the mappings behind various conceptual metaphors.

Things turn "Critical"

In the late 1970s theorists suggested that the surface realization of language represented the transformation of an underlying reality (Wilson 1990). The work was based, mainly, on Halliday's (1985) functional linguistic theory, which viewed language as a "social fact." In this view social and cognitive aspects become reflected within grammar. Politics and ideology were seen as displayed through grammatical structure, and analyzing language in this way was referred to as "Critical Linguistics." This approach has since been expanded, both in methodology and theory, and is now seen as part of the broader analytic program known as Critical Discourse Analysis (CDA). Wodak and Meyer (2009) moving the "linguistic" to a "multi- disciplinary and multi-methodological level"; although grammar remains a central tool in explaining how ideology, power, and domination become constituted through linguistic structures.

Van Dijk argues that CDA should not be seen as a method but as a form of critically driven theory and practice operationalized by politically concerned discourse analysts, whose aim is to use a variety of methods in the study of power abuse and inequality within society. Such an approach has been criticized for its own internal politicization, since it seems to begin with the assumption that certain data sets produce power abuse and then sets off to find and describe such abuse. Consequently, it is suggested that critical analysts are in danger of confirming what they already believed from the start. Further, CDA has been criticized for its claim to use linguistic analysis to confirm forms of power abuse. Widdowson (1995) argues that because of its critical orientation CDA "essentially sociological or socio-political rather than linguistic." And it is also

judgm 2 of 4

to be examined within the context of human cultures and vice versa. In addition, all of this must be examined within the context of the environment and historical processes. In an effort to be holistic, anthropology is often an interdisciplinary field that crosses over into other fields such as history, geology, and ecology.

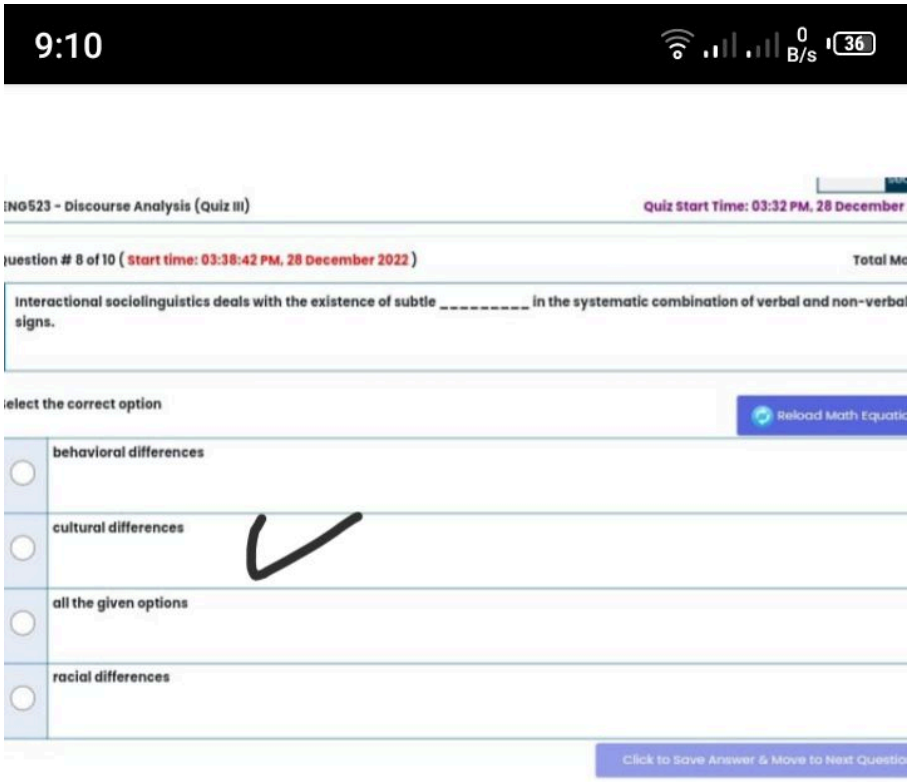

Relativism: Relativism means that judgments, truths, or moral values have no absolutes, and can only be understood relative to the situation or individuals involved. For anthropologists, this means that they accept that all cultures are of equal value and must be studied from a neutral point of view.

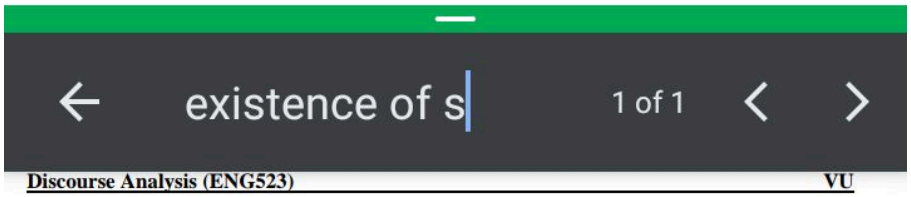

A good anthropologist must disregard their own beliefs, morals, and judgments when examining another culture. They must, instead, examine each culture within the context of its own beliefs.

Universalism: Universalism means that whatever the theoretical principle is, it's equally applicable to all. For anthropologists, universalism means that we believe all humans are equal in intelligence, complexity, etc. This is in contrast to ethnocentrism, which is the belief that some peoples are more important or culturally/biologically better than other peoples.

Culture: All humans have culture. Culture is the set of learned behaviors and knowledge that belong to a certain set of people. This is different from genetically hardwired behaviors (such as reflexes) in that they aren't biologically inherited. The most important thing to remember is that culture is learned.

This may differ from linguistic anthropology because linguists will focus more on the way words are formed, for example, the phonology or vocalization of the language to semantics and grammar systems. For example, linguists pay close attention to "code-switching," a phenomenon that occurs when two or more languages are spoken in a region and the speaker borrows or mixes the languages in normal discourse. For example, when a person is speaking a sentence in English but completes his or her thought in Spanish and the listener understands and continues the conversation in a similar way. A linguistic anthropologist may be interested in code-

Why is Interactional Sociolinguistics important?

Interactional Sociolinguistics is important because it draws our attention to the existence of subtle cultural differences in the systematic combination of verbal and non-verbal signs which signal contexts and construct meaning, differences that are often hard to pin down by those who use them. IS can claim credit for having shown in great detail that disastrous consequences may follow if such different styles remain hidden and lead to miscommunication in gatekeeping encounters: applicants do not only fail to get a job or admission to a course, but often find their personal and ethnic background targeted as the cause for communication failure. IS has thus managed to uncover meaning and reason behind communicative styles that are regularly identified as inarticulate and incoherent, and the social relevance of this cannot be underestimated. It has shown that seemingly unintelligible job applicants or uninterested children are in fact sensible and involved if you (are willing to) read their contextualization cues in an appropriate way or you are prepared to accept their different cueing habits.

IS has also illustrated that technically differing styles do not necessarily lead to miscommunication, just as miscommunication itself does not automatically lead to conflict or stereotyping. As mentioned above, a readiness for observing and acknowledging differences can overcome even seriously diverging communication styles, or, conversely, the absence of difference does not always prevent negative identification or willful misunderstanding from taking place. These findings invite us to look beyond the actual interactional setting and observe how interact-ants approach and evaluate one another as differently positioned social beings who may, depending on the circumstances, see each other as problematically or delightfully different. Even when the odds are unfavorable, interact-ants may find other identities, qualities or actions of a person valuable that may overrule communication difficulties and the effect of stereotyping (a talented football player's almost non-existent English will be passed over much more easily than that of an illegal refugee, who in her turn may find that her English is found cute and perfectly acceptable by her neighbors for whom she does babysitting). In other words, IS shows that communication is irrevocably a social happening where identities and relations matter, and

Narrative Structure

Journalists write stories, and accordingly, research into story structure or narrative becomes

Socio-cognitive approach to racism

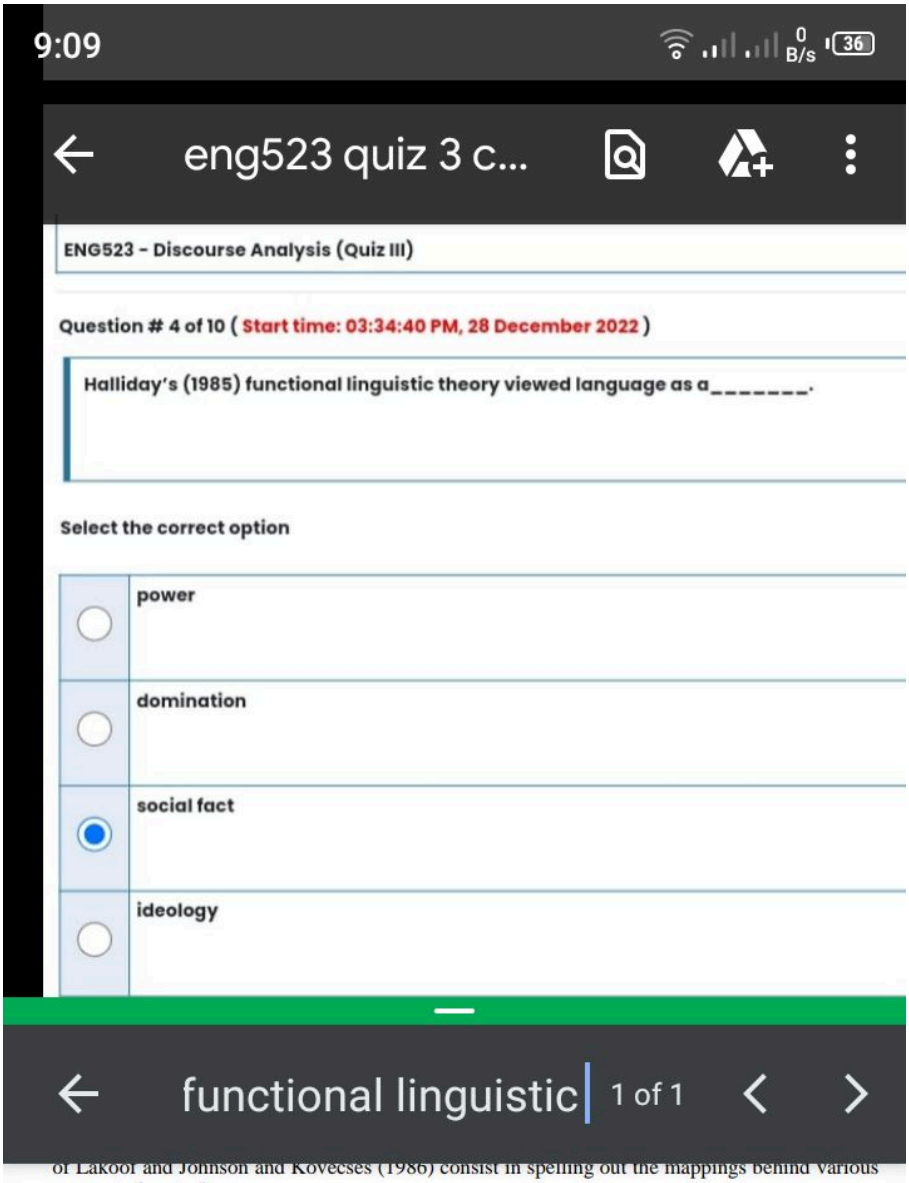

Discourse Studies as a cross discipline emerged in all the humanities and social sciences 50 years ago in the USA and various European countries, but initially focused mostly on formal aspects of text and talk: text grammar, semantic coherence and narrative and argumentation structures. A more sociopolitical orientation, Critical Discourse Studies (CDS), focused on forms of discursive power abuse, was initiated only in the 1980s, but since then has become very popular, for instance in the study of political discourse, media discourse and phenomena such as racism and sexism. Most forms of CDS establish direct links between discourse structures and social structures.

In a **socio-cognitive approach** this relation is mediated by cognitive structures, the only way heterogeneous discourse structures and social structures can be theoretically linked, for instance, by personal mental models and socially shared knowledge, attitudes and ideologies. Hence, a critical study of discourse must be based on such a socio-cognitive theory in order to be able to describe and explain the discursive reproduction of social domination, as well as the resistance against this domination.

Since the 1980s, social cognitive models have remained the most dominant and influential accounts of racial bias. These have their origins in Gordon Allport's seminal work, *The Nature of Prejudice (1954)*. Allport's definition of prejudice as "an antipathy based upon a faulty and inflexible generalization" (1954) about a social group and its members, emphasizes the role that social categorization and stereotyping play as perceptual-cognitive processes that underlie racial bias.

Categorizing people into their respective group memberships (such as race, gender, age) is seen to be driven primarily by our limited cognitive capacity and thereby our need to simplify the overwhelming amount of stimulus information we receive and need to process quickly and efficiently.

This group-based or category-based perception is seen as distorting reality because people are

describe and explain the discursive reproduction of social domination, as well as the resistance against this domination.

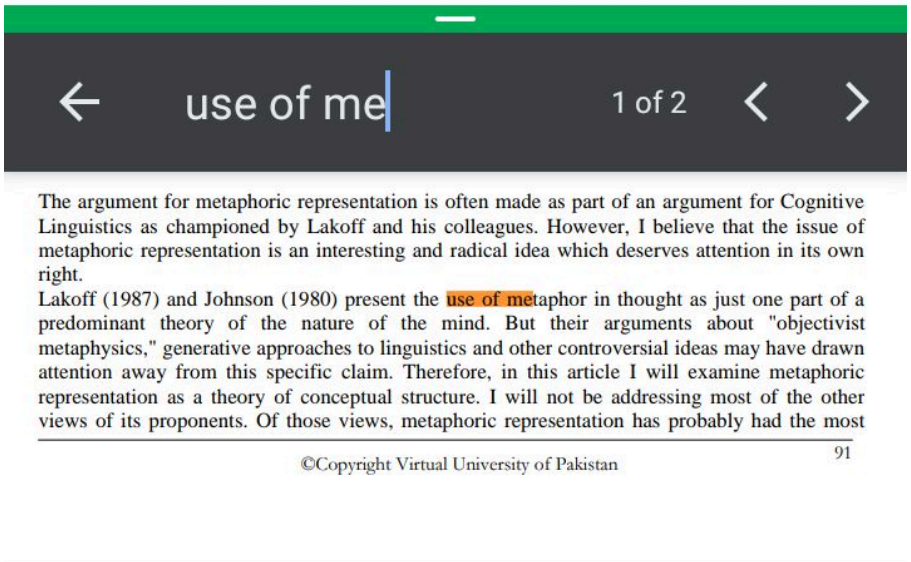

Since the 1980s, social cognitive models have remained the most dominant and influential accounts of racial bias. These have their origins in Gordon Allport's seminal work, *The Nature of Prejudice (1954)*. Allport's definition of prejudice as "an antipathy based upon a faulty and inflexible generalization" (1954) about a social group and its members, emphasizes the role that social categorization and stereotyping play as perceptual-cognitive processes that underlie racial bias.

Categorizing people into their respective group memberships (such as race, gender, age) is seen to be driven primarily by our limited cognitive capacity and thereby our need to simplify the overwhelming amount of stimulus information we receive and need to process quickly and efficiently.

This group-based or category-based perception is seen as distorting reality because people are not viewed as individuals in their own right but rather as prototypical group members. In turn, this leads to stereotyping, which recent social cognition research suggests can occur automatically and outside conscious awareness (Nosek, Hawkins & Frazier 2011). Stereotyping of course is just one step away from prejudice literally prejudging someone based solely on their group membership. This inextricable relationship between categorization, stereotyping and

©Copyright Virtual University of Pakistan

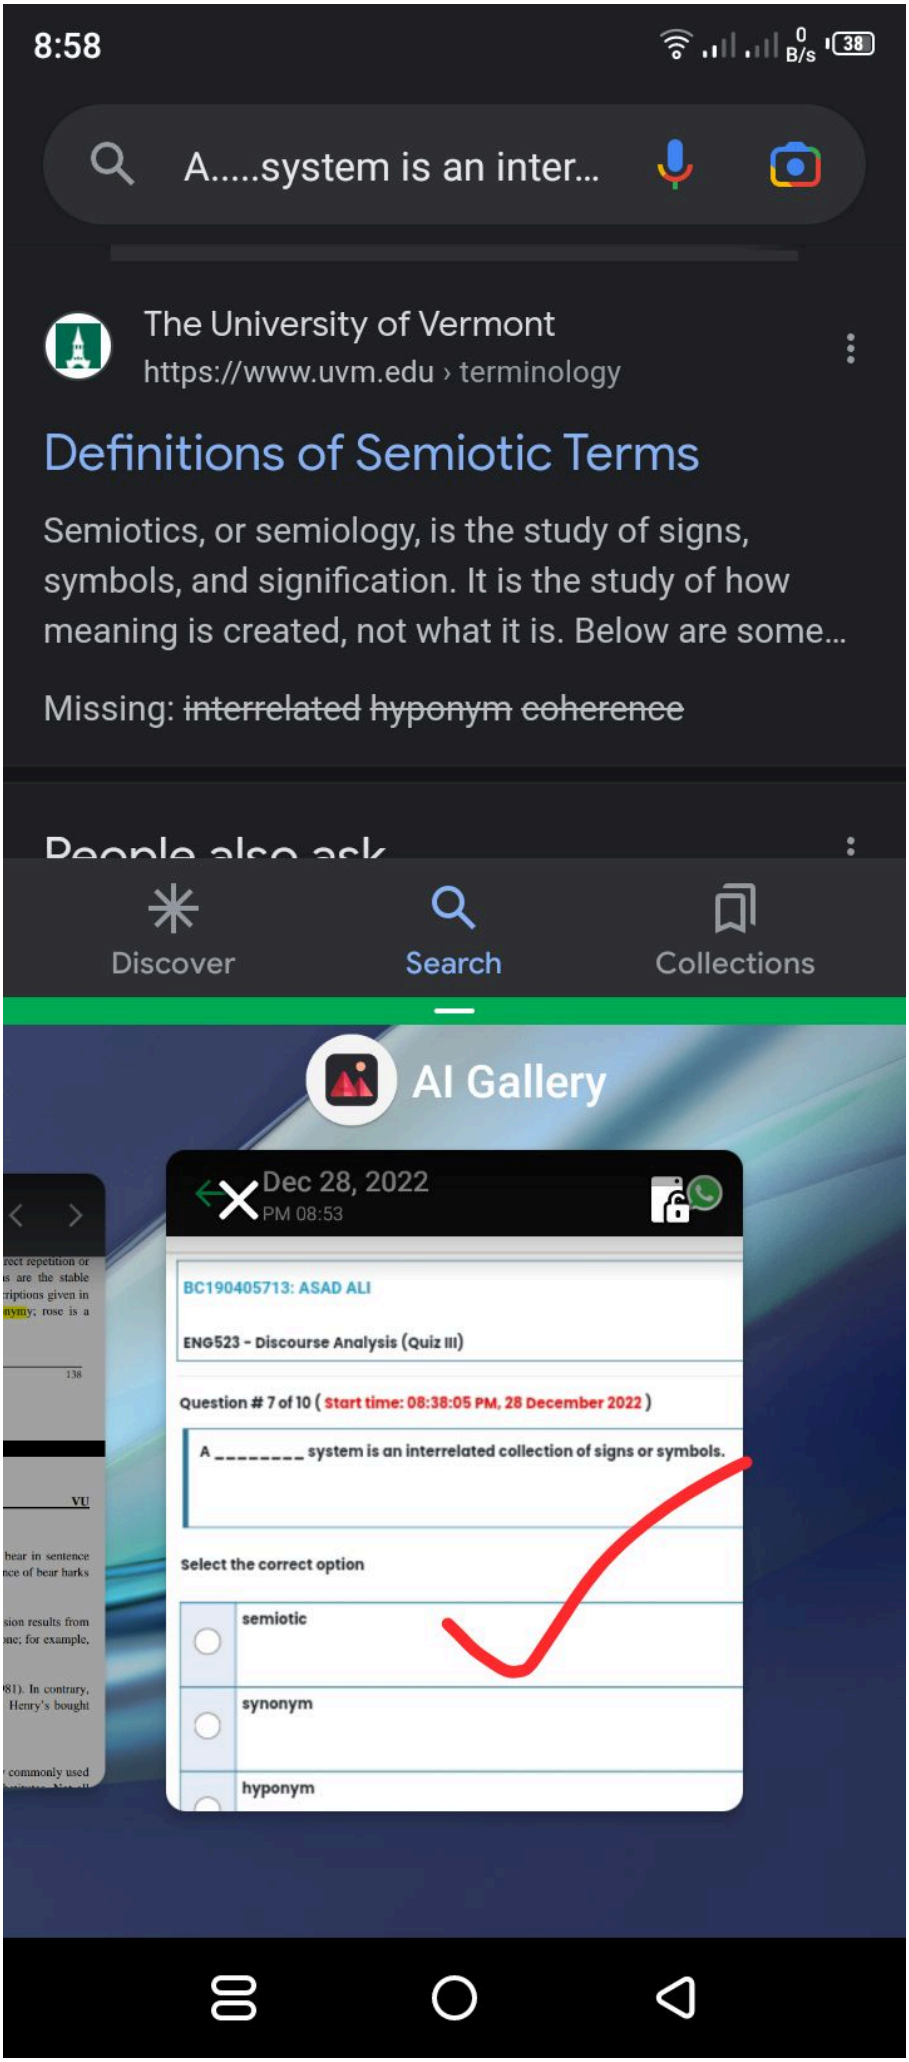

The argument for metaphoric representation is often made as part of an argument for Cognitive Linguistics as championed by Lakoff and his colleagues. However, I believe that the issue of metaphoric representation is an interesting and radical idea which deserves attention in its own right.

Lakoff (1987) and Johnson (1980) present the use of metaphor in thought as just one part of a predominant theory of the nature of the mind. But their arguments about "objectivist metaphysics," generative approaches to linguistics and other controversial ideas may have drawn attention away from this specific claim. Therefore, in this article I will examine metaphoric representation as a theory of conceptual structure. I will not be addressing most of the other views of its proponents. Of those views, metaphoric representation has probably had the most

©Copyright Virtual University of Pakistan

direct influence on psychological research, through theories of idiom and metaphor comprehension. That said, however, it will be impossible to avoid mentioning other views expressed by Lakoff and Johnson (1980) or Lakoff (1987), because some of them are used to provide support for the notion of metaphoric representation.

One **disadvantage** in discussing metaphoric representation is that it is necessary to discuss verbal metaphor. And as is well known, metaphor is one of the most difficult and intransigent problems in language. Indeed, even defining metaphor is by no means an easy task. For the present purposes, then, a minimal description will have to serve. In **verbal metaphor**, there are

- Stereotypes

biological 4 of 7

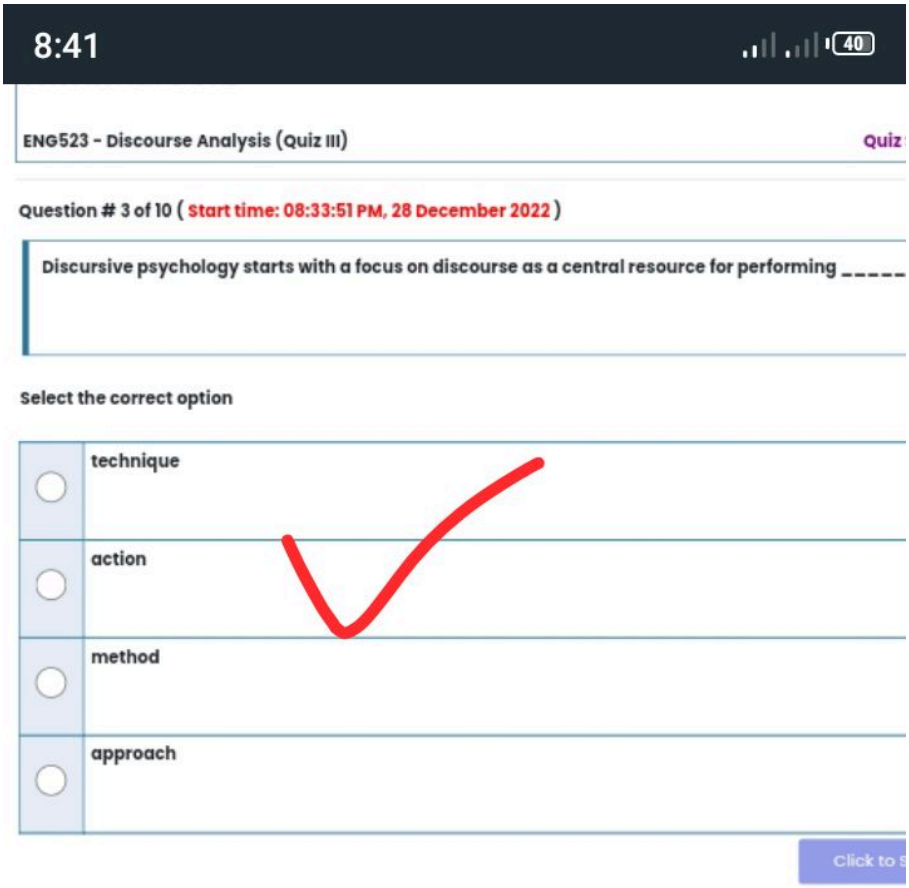

tempting to define "race", Dobzhansky (1946) states that:

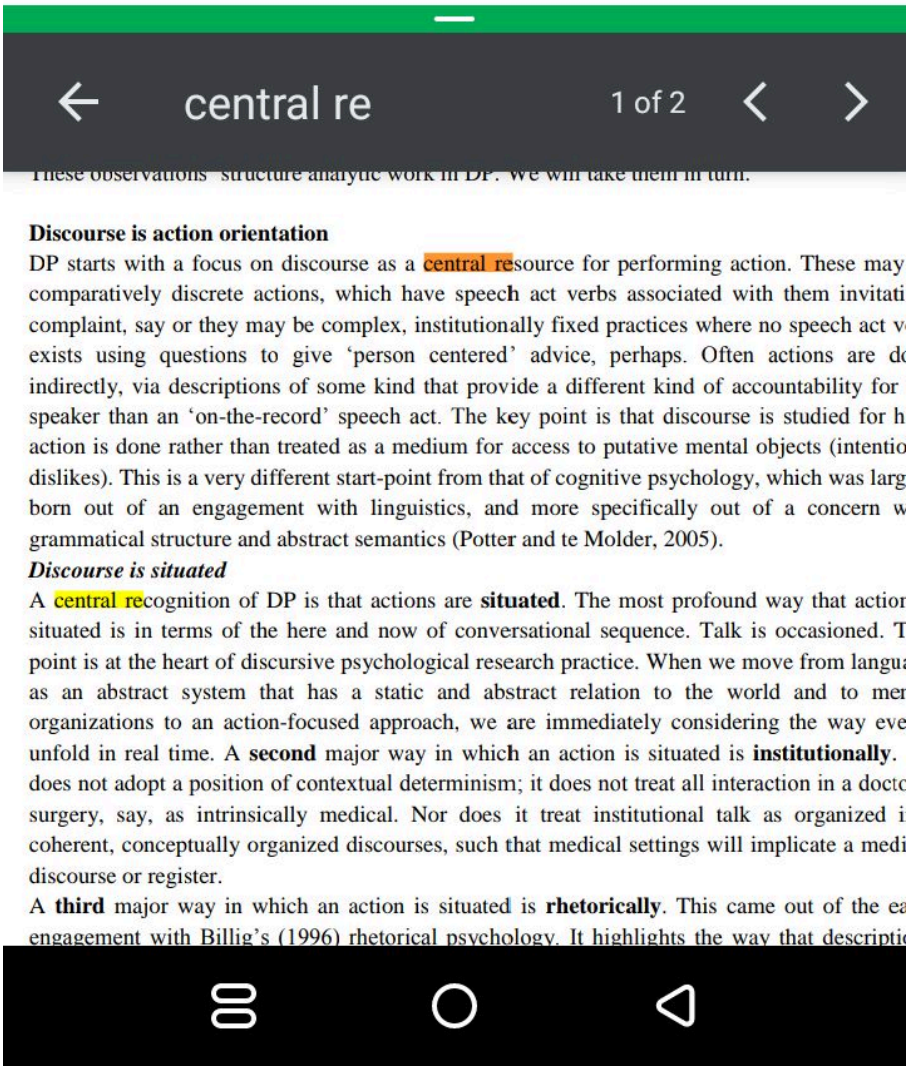

es are defined as populations differing in the incidence of certain genes but actually anging or potentially able to exchange genes across the boundary (usually geographic) that rates them." Race is considered as a biological, genetically determined concept.

ever, this scientific concept has been increasingly challenged. First, it has been argued that ontinued use of the term 'race' intensifies the problems of racism. As a result, some African ricans want to substitute color or 'colorism' because skin color is the most obvious sign of rence. Second, others challenge race from the perspective of the increased 'hybridity' bha, 1994) or racial mixing brought about by increasing globalization and the migration of le. In this context identity becomes very subjective especially because racism rejects such le their white parentage or heritage. Since mixed race persons are defined by their darker color not their ethnicity the concept of 'race' loses much of its validity. Lastly, the most rtant challenge to the use of the concept of race is, however that it is not biological rence as such that creates racism but its social construction.

ite these challenges the concept of race is still useful mainly because it promotes racism h is what the Ontario Human Rights Commission (OHRC) and anti-racists the world over is g to control. 'Race' is a biological reality which leads to the perception of difference which s to racism. The theoretical foundations of the relationship between race and the construction cism are complex and have important policy implications.

These observations structure analytic work in DP. We will take them in turn.
Discourse is action orientation
DP starts with a focus on discourse as a central resource for performing action. These may
comparatively discrete actions, which have speech act verbs associated with them invitati
complaint, say or they may be complex, institutionally fixed practices where no speech act v
exists using questions to give 'person centered' advice, perhaps. Often actions are d
indirectly, via descriptions of some kind that provide a different kind of accountability for
speaker than an 'on-the-record' speech act. The key point is that discourse is studied for h
action is done rather than treated as a medium for access to putative mental objects (intentio
dislikes). This is a very different start-point from that of cognitive psychology, which was larg
born out of an engagement with linguistics, and more specifically out of a concern w
grammatical structure and abstract semantics (Potter and te Molder, 2005).
Discourse is situated
A central recognition of DP is that actions are situated. The most profound way that actior
situated is in terms of the here and now of conversational sequence. Talk is occasioned. T
point is at the heart of discursive psychological research practice. When we move from langu
as an abstract system that has a static and abstract relation to the world and to mer
organizations to an action-focused approach, we are immediately considering the way eve
unfold in real time. A second major way in which an action is situated is institutionally.
does not adopt a position of contextual determinism; it does not treat all interaction in a doct
surgery, say, as intrinsically medical. Nor does it treat institutional talk as organized i
coherent, conceptually organized discourses, such that medical settings will implicate a medi
discourse or register.
A third major way in which an action is situated is rhetorically. This came out of the ea
engagement with Billig's (1996) rhetorical psychology. It highlights the way that descripti

DISCOURSE AND MEDIA

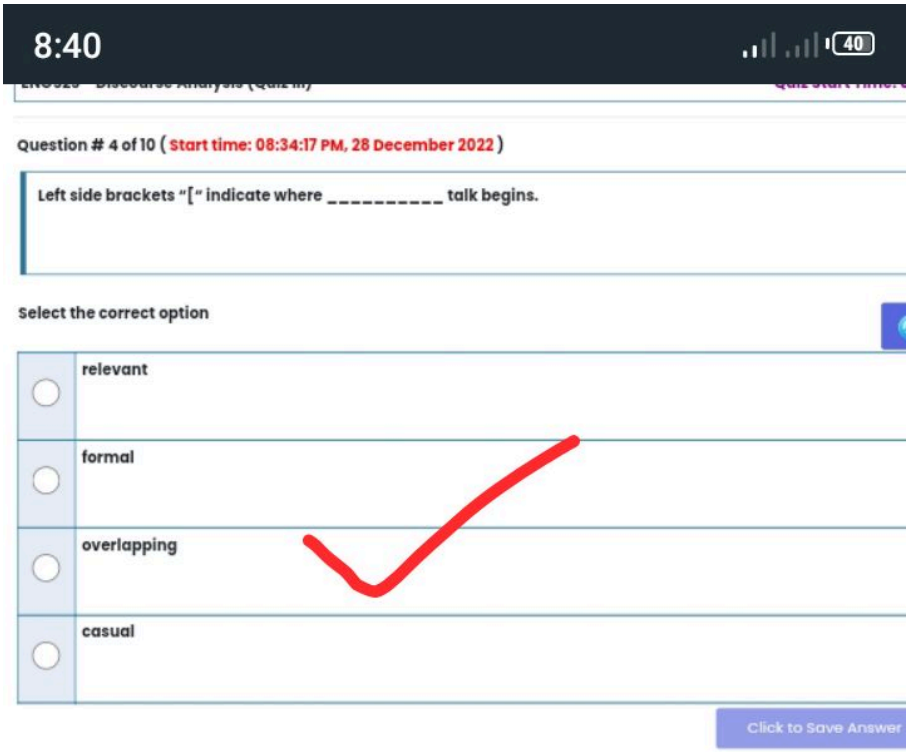

Approaches to Media Discourse

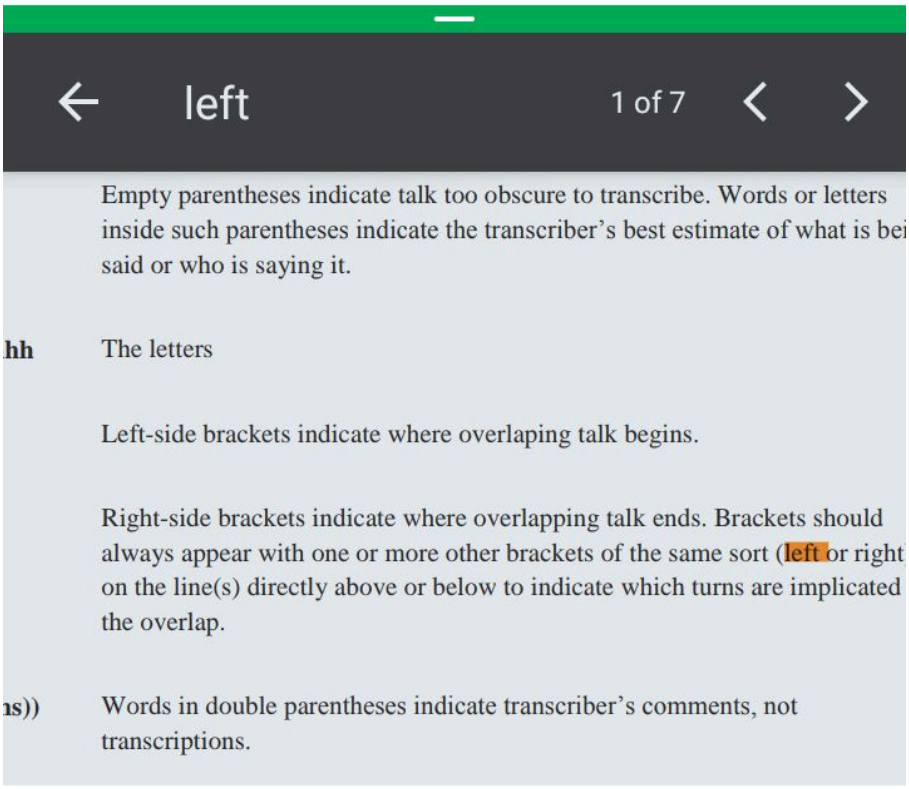

Media discourse refers to interactions that take place through a broadcast platform, whether spoken or written, in which the **discourse** is oriented to a non-present reader, listener or viewer. Though the discourse is oriented towards these recipients, they very often cannot make instantaneous responses to the producer of the discourse, though increasingly this is changing with the advent of new media technology, as we shall explore. Crucially, the written or spoken discourse itself is oriented to the readership or listening/viewing audience, respectively. In other words, media discourse is a public, manufactured, on-record, form of interaction. It is not ad hoc or spontaneous (in the same way as casual speaking or writing is); it is neither private nor off the record. Obvious as these basic characteristics may sound, they are crucial to the investigation, description and understanding of media discourse.

The three main approaches to the study of media discourse can be characterized as

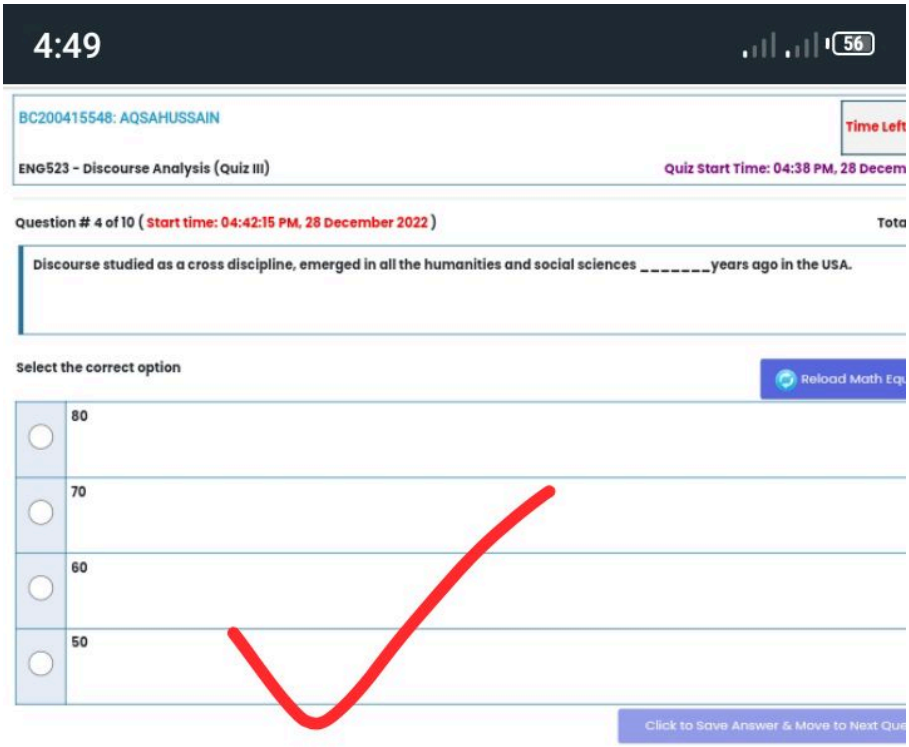

- Discourse analytic
- Sociolinguistic
- Nonlinguistic

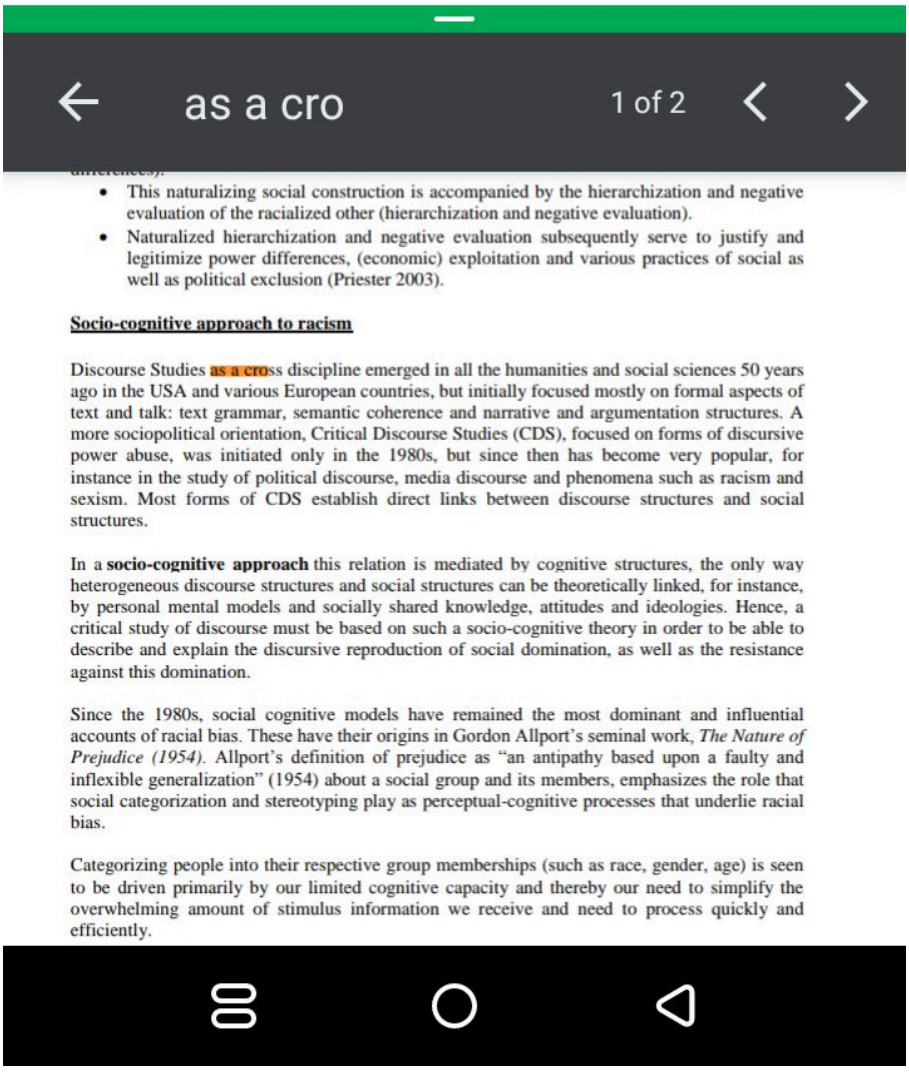

Discourse **analytic approach** is the primary focus of scholars in the study of media discourse. Discourse analytic approaches that underlie a great deal of the research on media can be characterized as hybrids of existing frameworks of pragmatics, conversation analysis, variation, narrative analysis and interactional sociolinguistics optionally interlaced with sociological content analysis. For example, the approach can be "critical" in the sense of looking at social impact or inequality or concern political economy in the sense of the social value of language without necessarily bring into line with a major tradition, such as discourse analysis or media

©Copyright Virtual University of Pakistan

- This naturalizing social construction is accompanied by the hierarchization and negative evaluation of the racialized other (hierarchization and negative evaluation).
- Naturalized hierarchization and negative evaluation subsequently serve to justify and legitimize power differences, (economic) exploitation and various practices of social as well as political exclusion (Priester 2003).

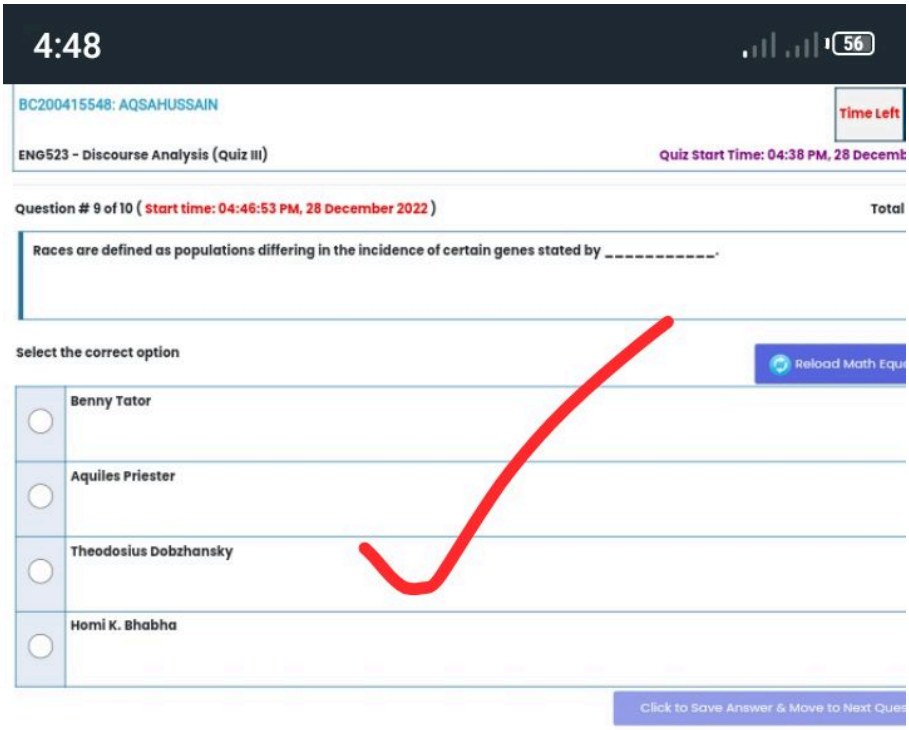

Socio-cognitive approach to racism

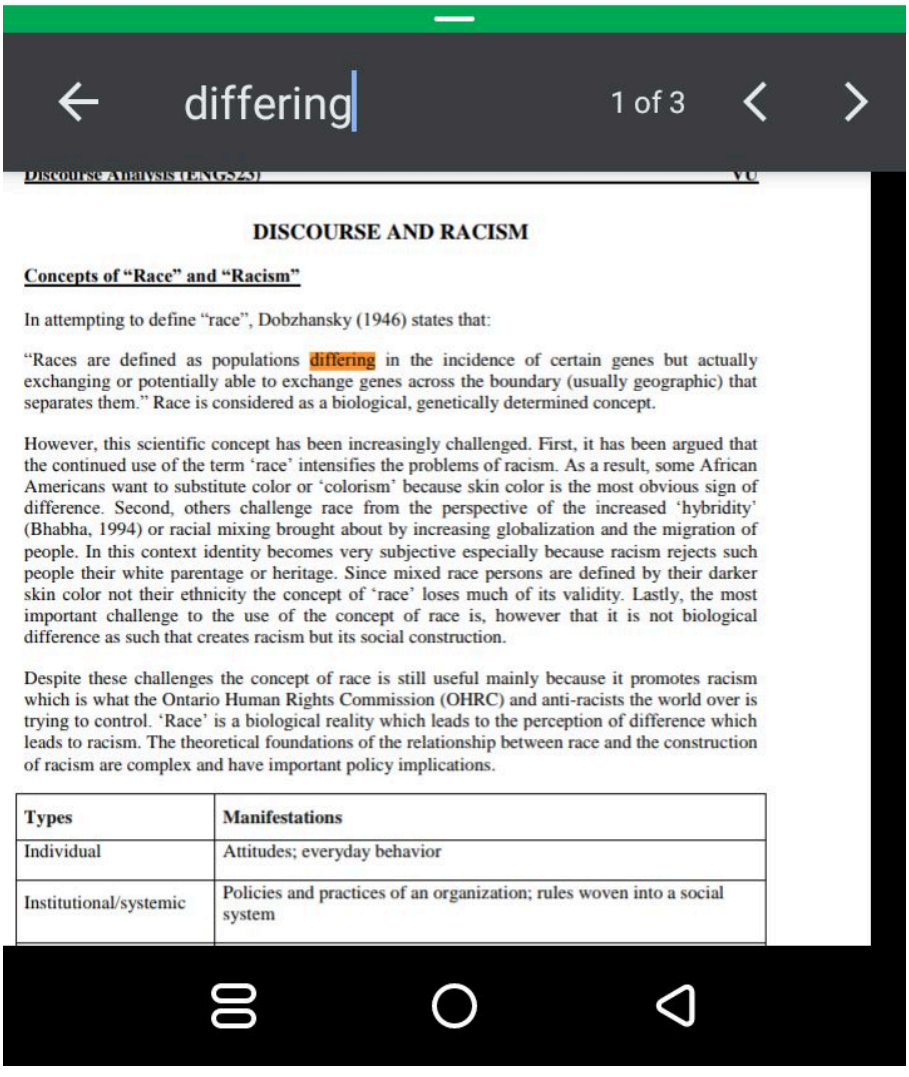

Discourse Studies as a cross discipline emerged in all the humanities and social sciences 50 years ago in the USA and various European countries, but initially focused mostly on formal aspects of text and talk: text grammar, semantic coherence and narrative and argumentation structures. A more sociopolitical orientation, Critical Discourse Studies (CDS), focused on forms of discursive power abuse, was initiated only in the 1980s, but since then has become very popular, for instance in the study of political discourse, media discourse and phenomena such as racism and sexism. Most forms of CDS establish direct links between discourse structures and social structures.

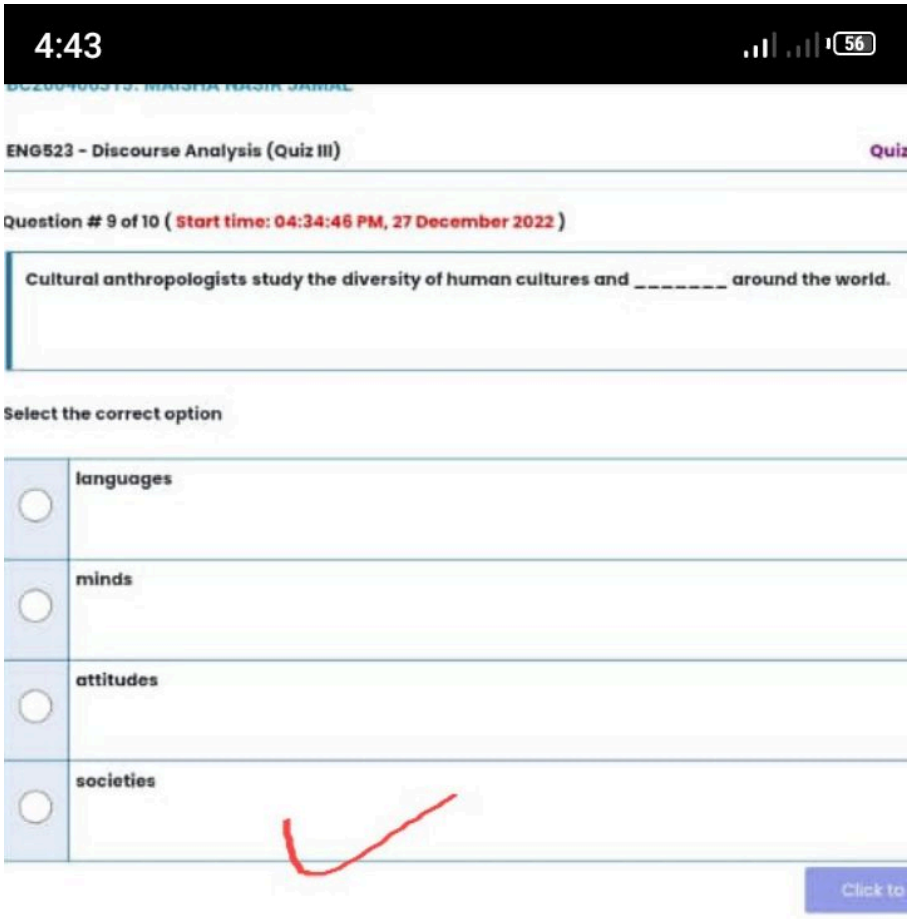

In a **socio-cognitive approach** this relation is mediated by cognitive structures, the only way heterogeneous discourse structures and social structures can be theoretically linked, for instance, by personal mental models and socially shared knowledge, attitudes and ideologies. Hence, a critical study of discourse must be based on such a socio-cognitive theory in order to be able to describe and explain the discursive reproduction of social domination, as well as the resistance against this domination.

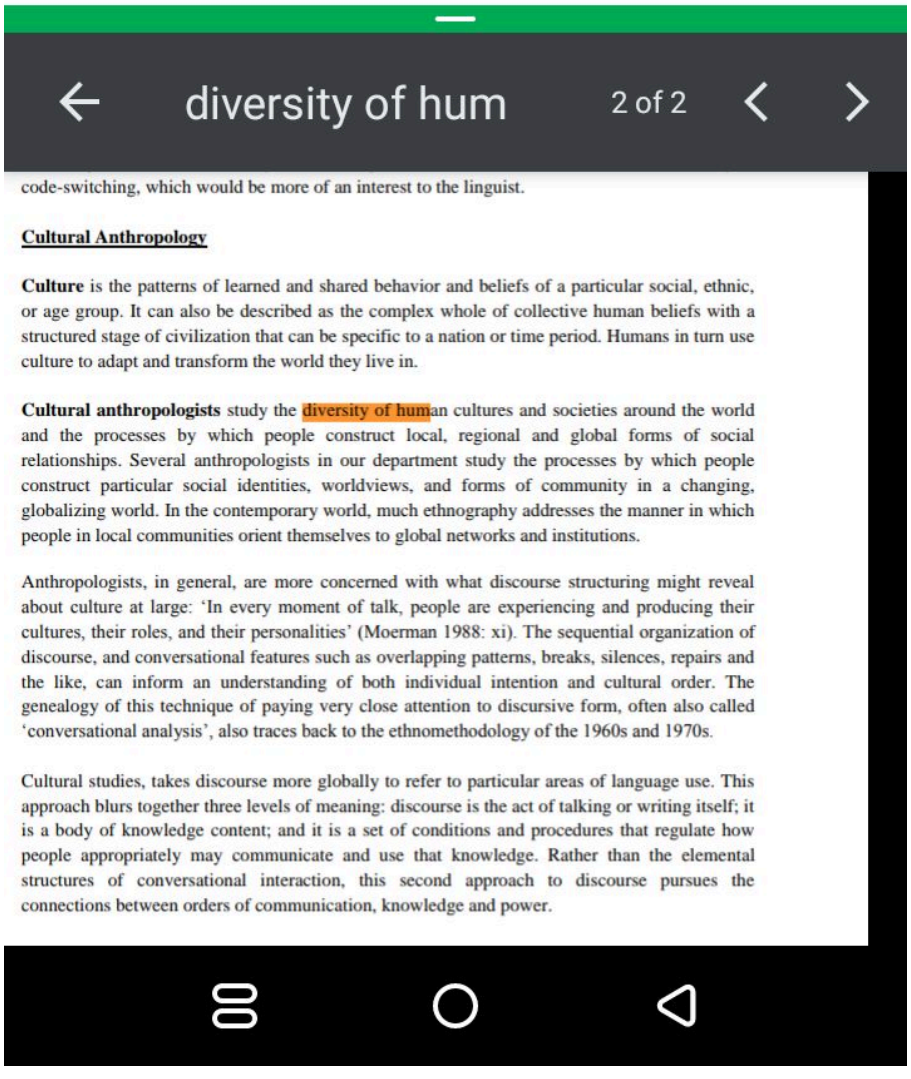

Since the 1980s, social cognitive models have remained the most dominant and influential accounts of racial bias. These have their origins in Gordon Allport's seminal work, *The Nature of Prejudice (1954)*. Allport's definition of prejudice as "an antipathy based upon a faulty and inflexible generalization" (1954) about a social group and its members, emphasizes the role that social categorization and stereotyping play as perceptual-cognitive processes that underlie racial bias.

Categorizing people into their respective group memberships (such as race, gender, age) is seen to be driven primarily by our limited cognitive capacity and thereby our need to simplify the overwhelming amount of stimulus information we receive and need to process quickly and efficiently.

DISCOURSE AND RACISM
Concepts of "Race" and "Racism"
In attempting to define "race", Dobzhansky (1946) states that:
"Races are defined as populations differing in the incidence of certain genes but actually exchanging or potentially able to exchange genes across the boundary (usually geographic) that separates them." Race is considered as a biological, genetically determined concept.
However, this scientific concept has been increasingly challenged. First, it has been argued that the continued use of the term 'race' intensifies the problems of racism. As a result, some African Americans want to substitute color or 'colorism' because skin color is the most obvious sign of difference. Second, others challenge race from the perspective of the increased 'hybridity' (Bhabha, 1994) or racial mixing brought about by increasing globalization and the migration of people. In this context identity becomes very subjective especially because racism rejects such people their white parentage or heritage. Since mixed race persons are defined by their darker skin color not their ethnicity the concept of 'race' loses much of its validity. Lastly, the most important challenge to the use of the concept of race is, however that it is not biological difference as such that creates racism but its social construction.
Despite these challenges the concept of race is still useful mainly because it promotes racism which is what the Ontario Human Rights Commission (OHRC) and anti-racists the world over is trying to control. 'Race' is a biological reality which leads to the perception of difference which leads to racism. The theoretical foundations of the relationship between race and the construction of racism are complex and have important policy implications.

Attitudes; everyday behavior
Institutional/systemic
Policies and practices of an organization; rules woven into a social system

code-switching, which would be more of an interest to the linguist.

Cultural Anthropology

Culture is the patterns of learned and shared behavior and beliefs of a particular social, ethnic, or age group. It can also be described as the complex whole of collective human beliefs with a structured stage of civilization that can be specific to a nation or time period. Humans in turn use culture to adapt and transform the world they live in.

Cultural anthropologists study the diversity of human cultures and societies around the world and the processes by which people construct local, regional and global forms of social relationships. Several anthropologists in our department study the processes by which people construct particular social identities, worldviews, and forms of community in a changing, globalizing world. In the contemporary world, much ethnography addresses the manner in which people in local communities orient themselves to global networks and institutions.

Anthropologists, in general, are more concerned with what discourse structuring might reveal about culture at large: 'In every moment of talk, people are experiencing and producing their cultures, their roles, and their personalities' (Moerman 1988: xi). The sequential organization of discourse, and conversational features such as overlapping patterns, breaks, silences, repairs and the like, can inform an understanding of both individual intention and cultural order. The genealogy of this technique of paying very close attention to discursive form, often also called 'conversational analysis', also traces back to the ethnomethodology of the 1960s and 1970s.

Cultural studies, takes discourse more globally to refer to particular areas of language use. This approach blurs together three levels of meaning: discourse is the act of talking or writing itself; it is a body of knowledge content; and it is a set of conditions and procedures that regulate how people appropriately may communicate and use that knowledge. Rather than the elemental structures of conversational interaction, this second approach to discourse pursues the connections between orders of communication, knowledge and power.

Question # 8 of 10 (Start time: 04:34:01 PM, 27 December 2022)

The term that involves variation and style in the media or a close analysis of language is_____

Select the correct option

- analytic approach
- discourse analysis
- non-linguistic
- sociolinguistic

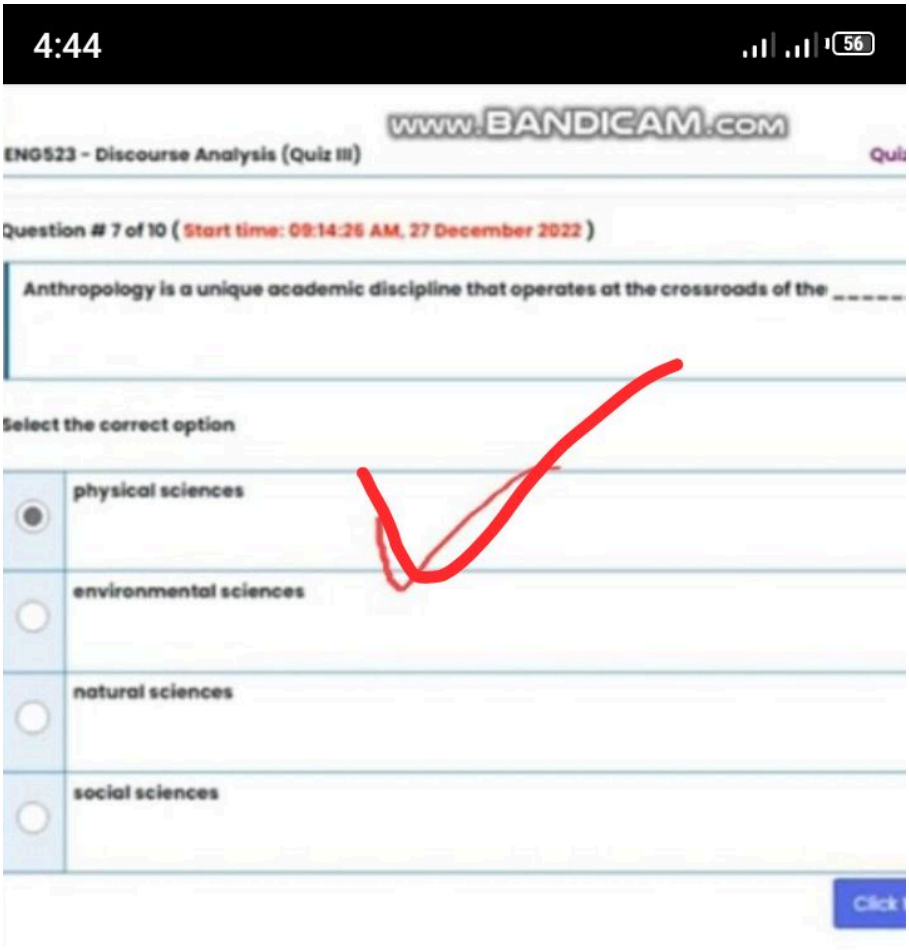

Click to

variation and style 1 of 2

Discourse **analytic approach** is the primary focus of scholars in the study of media discourse. Discourse analytic approaches that underlie a great deal of the research on media can be characterized as hybrids of existing frameworks of pragmatics, conversation analysis, variation, narrative analysis and interactional sociolinguistics optionally interlaced with sociological content analysis. For example, the approach can be "critical" in the sense of looking at social impact or inequality or concern political economy in the sense of the social value of language without necessarily bring into line with a major tradition, such as discourse analysis or media studies. **"Discourse analytic"** paradigm, which addresses discourse-level matters related to larger stretches of talk and text beyond the word or sentence level, including questions of participant, topic, function, and discourse structure, as well as a range of topics that includes news interviews, quotation and reported speech, register issues, politeness, positioning and framing.

The term **"sociolinguistic"** for work that involves variation and style in the media or a similar close analysis of language. Sociolinguistic insights, either to characterize some dimension of media language, such as variation and style, or to inform related discourse level work, such as genre and register. The **"nonlinguistic"** research involves work in political science, media studies, or communication studies paradigms and, to some degree, in cultural studies. Nonlinguistic domains are referred to by media discourse researchers perhaps more than in any other topical area of discourse analysis.

DISCOURSE ANALYSIS AND LINGUISTIC ANTHROPOLOGY

Physical Anthropology

Anthropology is a unique academic discipline that operates at the crossroads of the physical sciences, social sciences and humanities to examine the diversity of human experience across cultures and over time. Anthropologists in our department study everything from human evolution to prehistory to life in a globalizing world. Because of this breadth of focus, anthropology is highly relevant to understanding and living in a rapidly changing world.

Basic tenets of physical anthropology:

***Holism*:** Holism means that a part of something can only truly be understood if examined within relation to the whole of it. For anthropologists, this means that they try to understand humankind through the interrelationships of all aspects of human existence for example, human biology has to be examined within the context of human cultures and vice versa. In addition, all of this must be examined within the context of the environment and historical processes. In an effort to be holistic, anthropology is often an interdisciplinary field that crosses over into other fields such as history, geology, and ecology.

Relativism: Relativism means that judgments, truths, or moral values have no absolutes, and can only be understood relative to the situation or individuals involved. For anthropologists, this means that they accept that all cultures are of equal value and must be studied from a neutral point of view.

A good anthropologist must disregard their own beliefs, morals, and judgments when examining another culture. They must, instead, examine each culture within the context of its own beliefs.

Universalism: Universalism means that whatever the theoretical principle is, it's equally applicable to all. For anthropologists, universalism means that we believe all humans are equal in intelligence, complexity, etc. This is in contrast to ethnocentrism, which is the belief that some

DISCOURSE AND RELIGION

Religious Language

The term "religious language" refers to statements or claims made about God or gods. Here is a typical philosophical problem of religious language. If God is infinite, then words used to describe finite creatures might not adequately describe God. The ambiguity in meaning with respect to the terms predicated of God is the "problem of religious language" or the "problem of naming God." These predications could include divine attributes, properties, or actions.

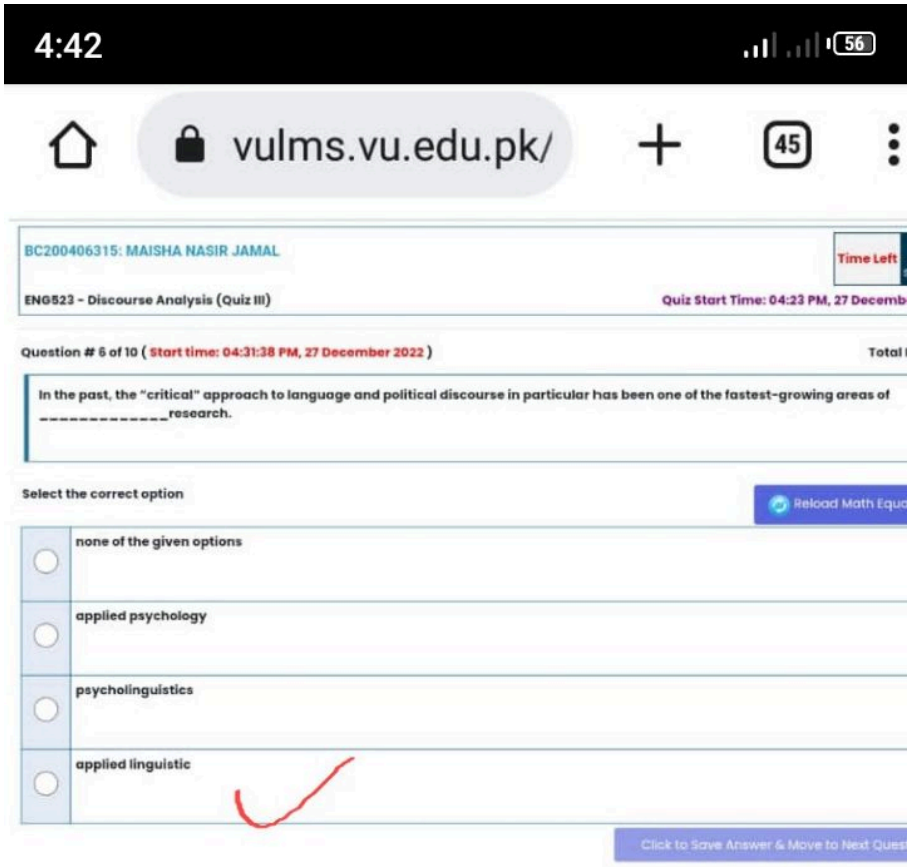

Religious discourse contains stories, supernatural characters, myth, attractive images and sometimes difficult logic. Therefore, religious texts are filled with metaphor. Metaphors differently interpret the text, "Christ is God and man," The metaphor is constructed to be interpreted in one way rather than another. Relations among words give to fuzziness. Metaphors lead to additional layers of meaning.

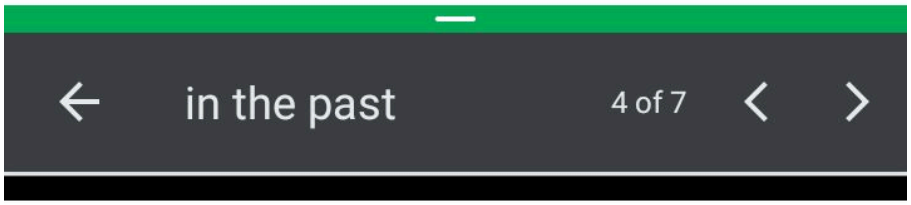

Multiplicity of meaning is encoded in the religious texts. Ambiguity is often found in religious texts. The word "God" has many meanings. God is benevolent, or malignant, kind, or cruel, a person or a symbol, etc. Religious contexts can be revealing Ritual speeches as display a degree of repetition mysterious vocabulary, unusual intonation mark the discourse.

John Du Bois (1996) identified some of the features of Religious language:

- Use of rituals
- Archaic elements
- Euphemism and metaphor
- Semantic opacity
- Unusual fluency
- Magic words

Religious discourse has already been enlightening for us in a narrower sense. Much work on the

possible that the political critique of political discourse for political purposes becomes a form of political discourse itself.

In the past 20 years the "critical" approach to language and to political discourse in particular, has been one of the fastest-growing areas of applied linguistic research. Many of the scholars writing on CDA have also been leaders in the field of political discourse; for example, Norman Fairclough, Ruth Wodak, and Teun van Dijk. The critical analyst sees political discourse as the use of words and phrases, syntactic processes, and discursive positioning, to either hide or distribute responsibility in certain ways, or designate specific individuals or groups as belonging to categories that may serve particular political purposes.

Political Sounds

In studies of political discourse there has been relatively little attention given to how politicians make use of phonetic, phonological, or supra-segmental features of language for political purposes. Sociolinguistic research indicates that the way we sound has an impact on how people perceive us, and this can range from our attractiveness and intelligence to our trustworthiness and employability.

We know that Margaret Thatcher modified her speech to make herself more attractive to voters, and that UK Prime Minister David Cameron's upper-class accent "turns off" some voters. In the United States recent work has suggested that ex-Secretary of State Condoleezza Rice adopts selected African American speech forms in specific speech contexts and Hall-Lew, Coppock, and Starr (2010) claim that American politicians' production of "Iraq's" second vowel marks "political conservatism" when produced as /æ/ but political liberalism when produced as /a:/.

In studies of prosody within political interviews, politicians reflect a very fluid and positive style, with only short pauses in syntactically appropriate positions. It has also been claimed that the sounds of politicians' own names, along with the rhythmic patterns they project, can also assist, or hinder, a politicians' aim of attracting voters (Smith 1998). Duez (1997) has attempted to

forms of discursive 1 of 1

well as political exclusion (Priester 2005).

Socio-cognitive approach to racism

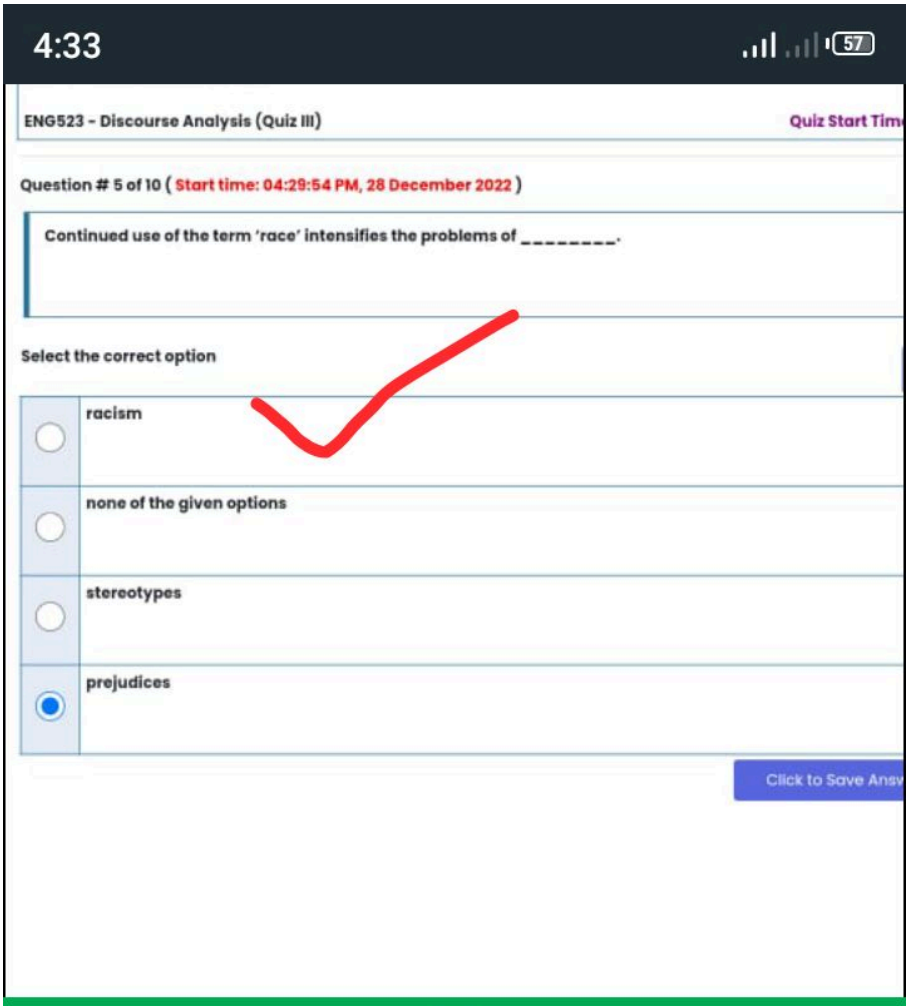

Discourse Studies as a cross discipline emerged in all the humanities and social sciences 50 years ago in the USA and various European countries, but initially focused mostly on formal aspects of text and talk: text grammar, semantic coherence and narrative and argumentation structures. A more sociopolitical orientation, Critical Discourse Studies (CDS), focused on forms of discursive power abuse, was initiated only in the 1980s, but since then has become very popular, for instance in the study of political discourse, media discourse and phenomena such as racism and sexism. Most forms of CDS establish direct links between discourse structures and social structures.

In a **socio-cognitive approach** this relation is mediated by cognitive structures, the only way heterogeneous discourse structures and social structures can be theoretically linked, for instance, by personal mental models and socially shared knowledge, attitudes and ideologies. Hence, a critical study of discourse must be based on such a socio-cognitive theory in order to be able to describe and explain the discursive reproduction of social domination, as well as the resistance against this domination.

Since the 1980s, social cognitive models have remained the most dominant and influential accounts of racial bias. These have their origins in Gordon Allport's seminal work, *The Nature of Prejudice (1954)*. Allport's definition of prejudice as "an antipathy based upon a faulty and inflexible generalization" (1954) about a social group and its members, emphasizes the role that social categorization and stereotyping play as perceptual-cognitive processes that underlie racial bias.

Categorizing people into their respective group memberships (such as race, gender, age) is seen to be driven primarily by our limited cognitive capacity and thereby our need to simplify the overwhelming amount of stimulus information we receive and need to process quickly and efficiently.

This group-based or category-based perception is seen as distorting reality because people are not viewed as individuals in their own right but rather as prototypical group members. In turn, this leads to stereotyping, which recent social cognition research suggests can occur automatically and outside conscious awareness (Nosek, Hawkins & Frazier 2011). Stereotyping

Concepts of "Race" and "Racism"

In attempting to define "race", Dobzhansky (1946) states that:

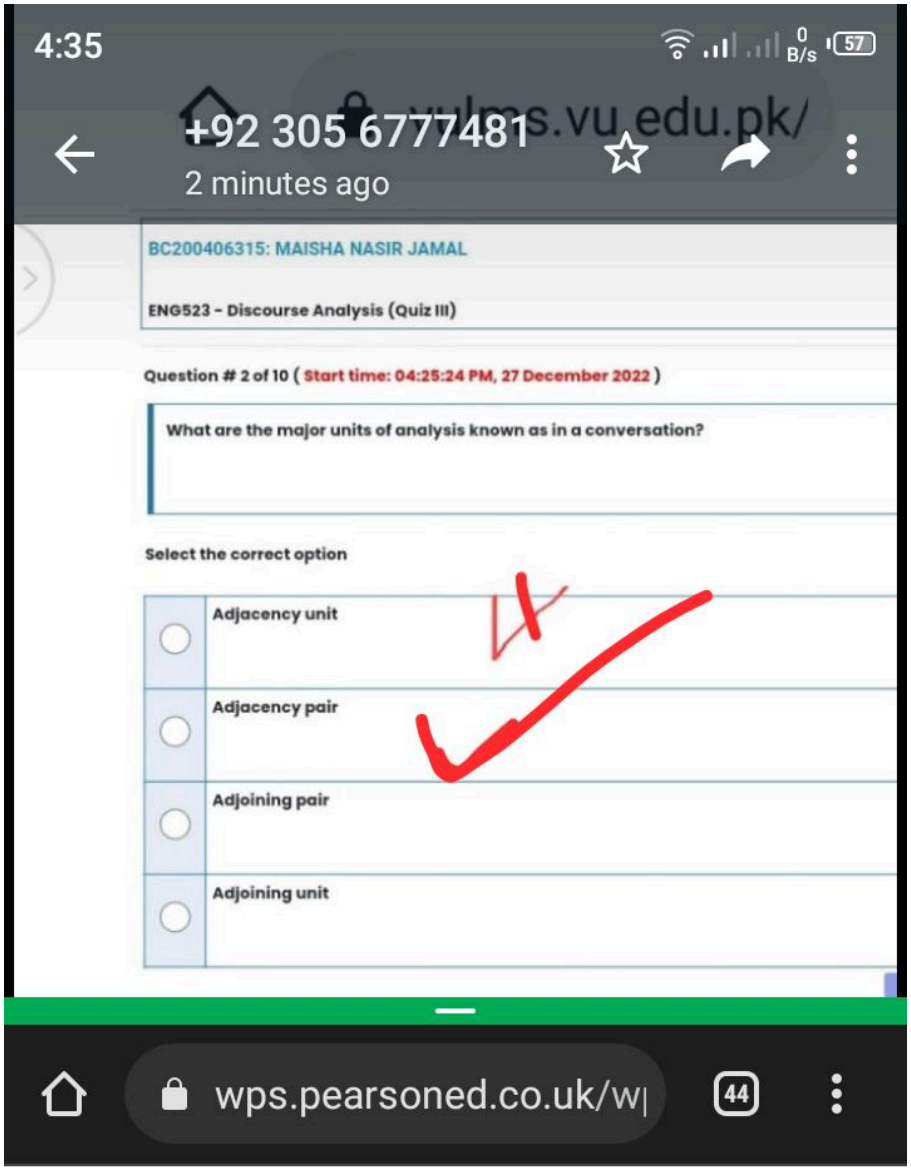

"Races are defined as populations differing in the incidence of certain genes but actually exchanging or potentially able to exchange genes across the boundary (usually geographic) that separates them." Race is considered as a biological, genetically determined concept.

However, this scientific concept has been increasingly challenged. First, it has been argued that the continued use of the term 'race' intensifies the problems of racism. As a result, some African Americans want to substitute color or 'colorism' because skin color is the most obvious sign of difference. Second, others challenge race from the perspective of the increased 'hybridity' (Bhabha, 1994) or racial mixing brought about by increasing globalization and the migration of people. In this context identity becomes very subjective especially because racism rejects such people their white parentage or heritage. Since mixed race persons are defined by their darker skin color not their ethnicity the concept of 'race' loses much of its validity. Lastly, the most important challenge to the use of the concept of race is, however that it is not biological difference as such that creates racism but its social construction.

Despite these challenges the concept of race is still useful mainly because it promotes racism which is what the Ontario Human Rights Commission (OHRC) and anti-racists the world over is trying to control. 'Race' is a biological reality which leads to the perception of difference which leads to racism. The theoretical foundations of the relationship between race and the construction of racism are complex and have important policy implications.

Narrative Structure

Journalists write stories, and accordingly, research into story structure or narrative becomes relevant to account for their motivations. Frameworks that have been successfully applied to other domains of talk, such as Labov's (1972) narrative framework have also been applied to news discourse. For example, Bell (1991) uses Labov's framework to examine the global narrative structure of news across local and national news boundaries, while van Dijk (1988) outlines a "theory of discourse schemata," which includes the traditional Labovian narrative schema as well as a more elaborated "news schema" a "series of hierarchically ordered categories" that helps define the discourse (van Dijk 1988: 49). Bell (1991, 1994, and 1998) has long compared the structure of news stories to personal narratives, noting their similarities and divergences, and using the Labovian framework as a point of departure.

The discursive elaboration and alteration of time elements in the news narrative is another feature distinctive to media discourse. Linear chronology is not important in a news story to the extent one would think: "Perceived news value overturns temporal sequence and imposes an order completely at odds with the linear narrative point" (Bell 1991). In their manipulation of sequential elements, reporters are not stenographers or transcribers; they are storytellers and interpreters. This point about a reordered "news chronology," constrained by the norms of text and content that underlie news discourse, comes up again in the work of media researchers Manoff and Schudson (1986).

Ultimately, the researchers are trying to determine what the placement of these profession bounded informational elements means in the context of news structure and discourse organization. The surface simplicity of the writing rules (which are standard across newswriting textbooks) and the complexity of their outputs (which varies across presentation domains) have only begun to get the attention they deserve. Bell (1991), for instance, notes the common practice in news-story construction of embedding one speech event into another. For example, a

DISCOURSE ANALYSIS AND LINGUISTIC ANTHROPOLOGY

Physical Anthropology

Anthropology is a unique academic discipline that operates at the crossroads of the physical sciences, social sciences and humanities to examine the diversity of human experience across cultures and over time. Anthropologists in our department study everything from human evolution to prehistory to life in a globalizing world. Because of this breadth of focus, anthropology is highly relevant to understanding and living in a rapidly changing world.

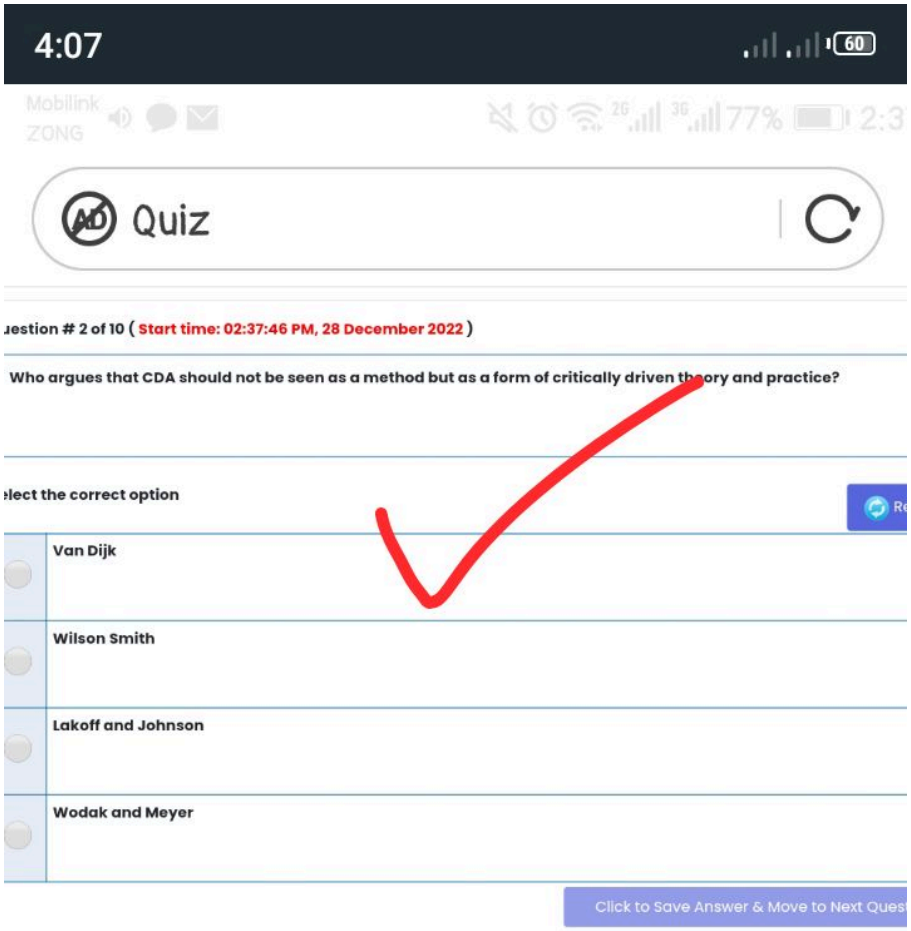

Basic tenets of physical anthropology:

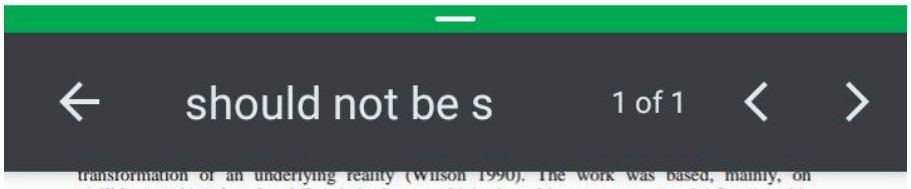

***Holism*:** Holism means that a part of something can only truly be understood if examined within relation to the whole of it. For anthropologists, this means that they try to understand humankind through the interrelationships of all aspects of human existence for example, human biology has to be examined within the context of human cultures and vice versa. In addition, all of this must be examined within the context of the environment and historical processes. In an effort to be holistic, anthropology is often an interdisciplinary field that crosses over into other fields such as history, geology, and ecology.

Relativism: Relativism means that judgments, truths, or moral values have no absolutes, and can only be understood relative to the situation or individuals involved. For anthropologists, this means that they accept that all cultures are of equal value and must be studied from a neutral point of view.

A good anthropologist must disregard their own beliefs, morals, and judgments when examining another culture. They must, instead, examine each culture within the context of its own beliefs.

Universalism: Universalism means that whatever the theoretical principle is, it's equally applicable to all. For anthropologists, universalism means that we believe all humans are equal in intelligence, complexity, etc. This is in contrast to ethnocentrism, which is the belief that some peoples are more important or culturally/biologically better than other peoples.

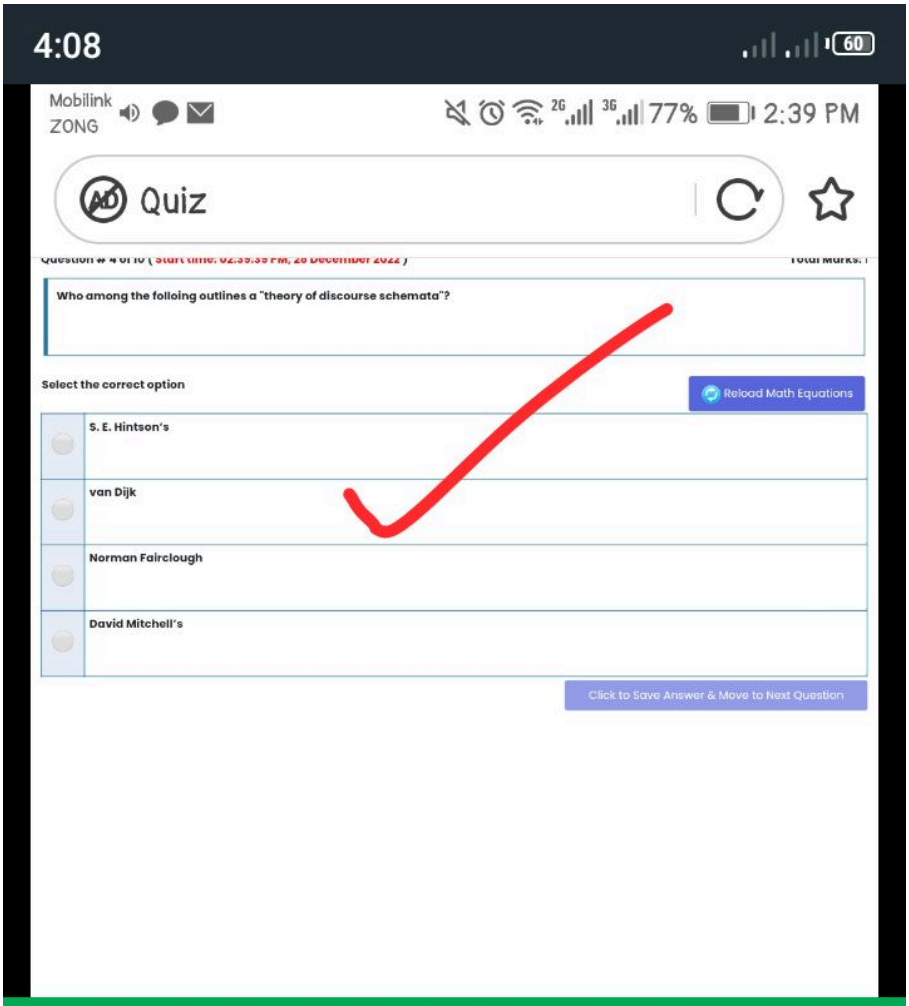

transformation of an underlying reality (Wilson 1990). The work was based, mainly, on Halliday's (1985) functional linguistic theory, which viewed language as a "social fact." In this view social and cognitive aspects become reflected within grammar. Politics and ideology were seen as displayed through grammatical structure, and analyzing language in this way was referred to as "Critical Linguistics." This approach has since been expanded, both in methodology and theory, and is now seen as part of the broader analytic program known as Critical Discourse Analysis (CDA). Wodak and Meyer (2009) moving the "linguistic" to a "multi- disciplinary and multi-methodological level"; although grammar remains a central tool in explaining how ideology, power, and domination become constituted through linguistic structures.

Van Dijk argues that CDA should not be seen as a method but as a form of critically driven theory and practice operationalized by politically concerned discourse analysts, whose aim is to use a variety of methods in the study of power abuse and inequality within society. Such an approach has been criticized for its own internal politicization, since it seems to begin with the assumption that certain data sets produce power abuse and then sets off to find and describe such abuse. Consequently, it is suggested that critical analysts are in danger of confirming what they already believed from the start. Further, CDA has been criticized for its claim to use linguistic analysis to confirm forms of power abuse. Widdowson (1995) argues that because of its critical orientation CDA "essentially sociological or socio-political rather than linguistic." And it is also

Journalists write stories, and accordingly, research into story structure or narrative becomes relevant to account for their motivations. Frameworks that have been successfully applied to other domains of talk, such as Labov's (1972) narrative framework have also been applied to news discourse. For example, Bell (1991) uses Labov's framework to examine the global narrative structure of news across local and national news boundaries, while van Dijk (1988) outlines a "theory of discourse schemata," which includes the traditional Labovian narrative schema as well as a more elaborated "news schema" a "series of hierarchically ordered categories" that helps define the discourse (van Dijk 1988: 49). Bell (1991, 1994, and 1998) has long compared the structure of news stories to personal narratives, noting their similarities and divergences, and using the Labovian framework as a point of departure.

The discursive elaboration and alteration of time elements in the news narrative is another feature distinctive to media discourse. Linear chronology is not important in a news story to the extent one would think: "Perceived news value overturns temporal sequence and imposes an order completely at odds with the linear narrative point" (Bell 1991). In their manipulation of sequential elements, reporters are not stenographers or transcribers; they are storytellers and interpreters. This point about a reordered "news chronology," constrained by the norms of text and content that underlie news discourse, comes up again in the work of media researchers Manoff and Schudson (1986).

Ultimately, the researchers are trying to determine what the placement of these profession bounded informational elements means in the context of news structure and discourse organization. The surface simplicity of the writing rules (which are standard across newswriting textbooks) and the complexity of their outputs (which varies across presentation domains) have only begun to get the attention they deserve. Bell (1991), for instance, notes the common practice in news-story construction of embedding one speech event into another. For example, a quotation from an interview is surrounded by information from a press release, but on the surface it is realized as a unified, coherent "story." Likewise, Cotter (1999a, in press), in discussing the progress of a story through time, and Knight and Nakano (1999), in delineating the "press release reality" that informed reporting of the historic 1997 Hong Kong handover, elaborate on the role of multiple texts and multiple authors in the production of news. This multiparty/multi-element infrastructure has been remarked on by other researchers (such as van Dijk 1988), who draw a
