Which of the following is untrue about the Unweighted Pair Group Method Using Arithmetic Average?

Select the correct option

- The simplest clustering method is UPGMA, which builds a tree by a sequential clustering method
- Given a distance matrix, it starts by grouping two taxa with the largest pairwise distance in the distance matrix
- (●) The distances between this new composite taxon and all remaining taxa are calculated to create a reduced matrix

Answer solved by Amaan Khan
Contact: 0305-4716616
Email: maniamaan2@gmail.com

- The grouping process is repeated and another newly reduced matrix is created

Which of the following does not describe local alignment?

Quiz Start Time: 12:16 AM, 21

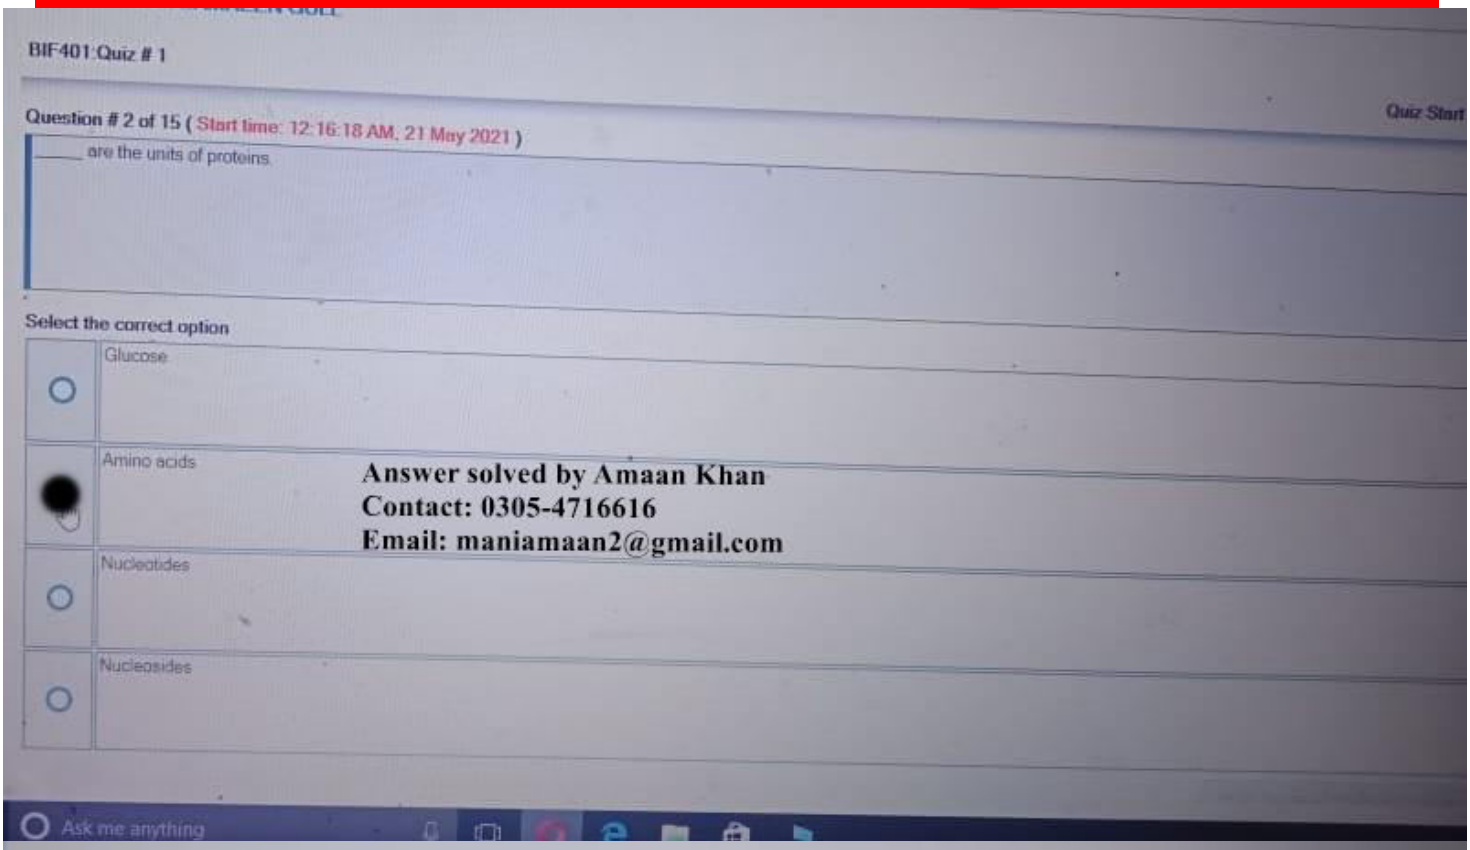

Select the correct option

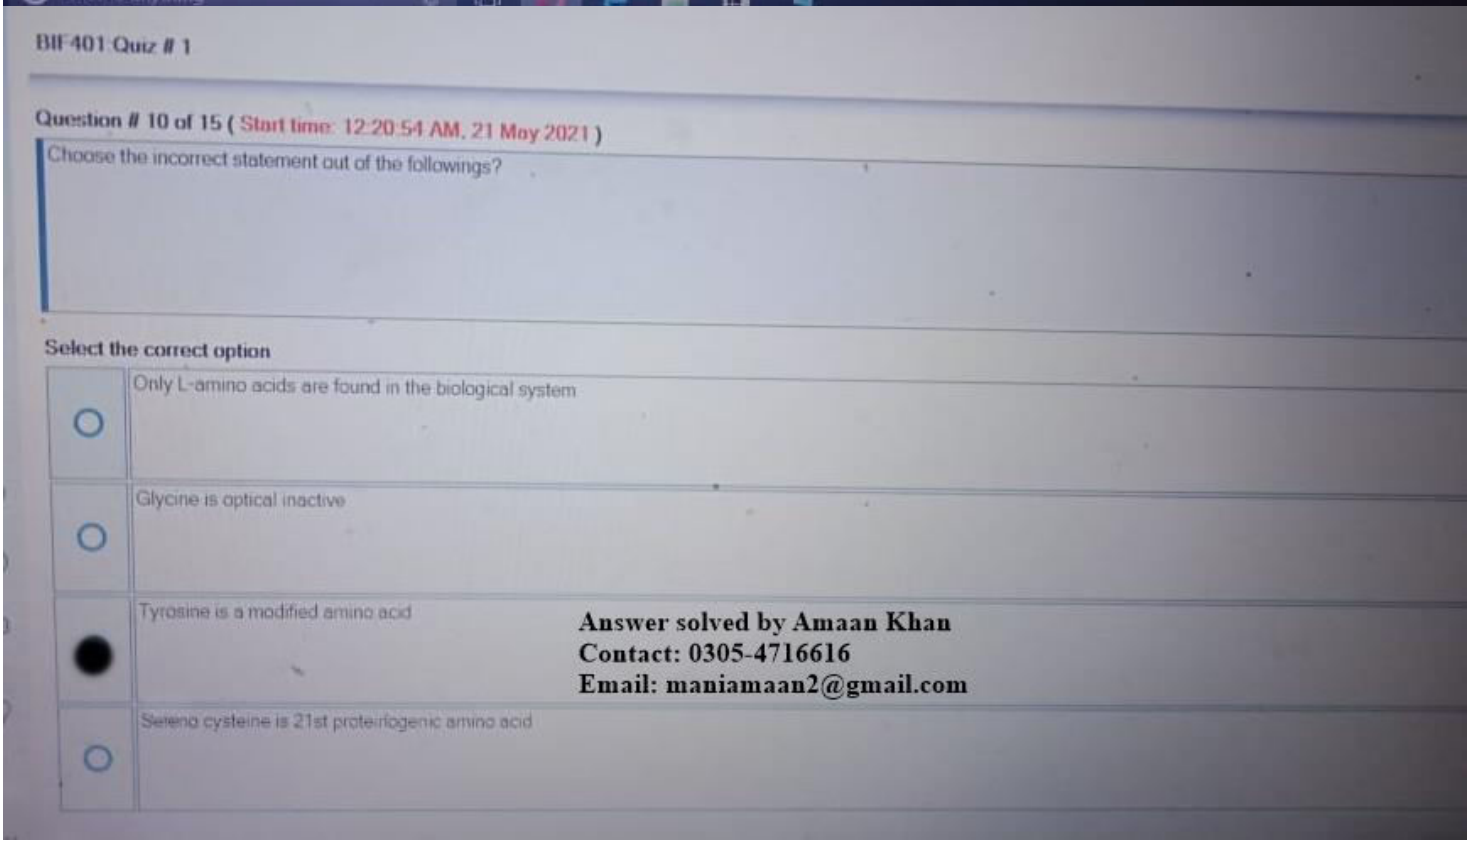

- A local alignment aligns a substring of the query sequence to a substring of the target sequence
- A local alignment is defined by maximizing the alignment score, so that deleting a column from either end would reduce the score, and adding further columns at either end would also reduce the score
- Local alignments have terminal gaps
- The substrings to be examined may be all of one or both sequences; if all of both are included then the local alignment is also global
