passive immunity

noun PHYSIOLOGY

the short-term immunity which results from the introduction of antibodies from another person or animal.

Definitions from Oxford Languages *Feedback*

Translations and more definitions

Passive immunity

Passive immunity is the transfer of active humoral immunity of ready-made antibodies. Passive immunity can occur naturally, when maternal antibodies are transferred to the fetus through the placenta, ... Wikipedia

People also search for: Therapy, Vaccine, Immunotherapy, Monoclonal antibody, **more**

Scanned with CamScanner

Maternal **passive immunity**, or natural **passive immunity**, is **immunity** passed along from mother to child. Before the child is born, antibodies are passed through the placenta to protect the child from illness. ... The rabies vaccine and snake antivenom are two **examples** of antiserums that yield **passive immunity**.

Active vs Passive Immunity: Differences and Definition ...

Composed by Zainab Arshad

More results

What is passive immunity in biology?

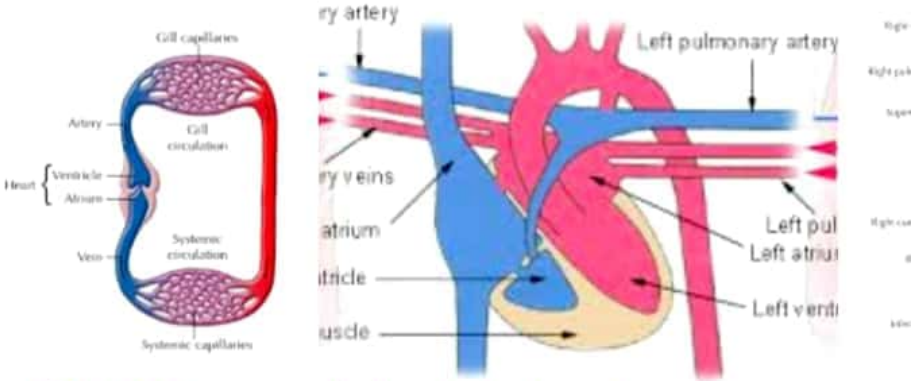

Passive immunity: **Immunity** produced by the transfer to one person of antibodies that were produced by another person. Protection from **passive immunity** diminishes in a relatively short time, usually a few weeks or months.

transport system in vertebrates

ALL IMAGES VIDEOS NEWS MAPS

Composed by Zainab Arshad

The cardiovascular **system** consists of the heart (cardio) and the vessels required for **transport** of blood (vascular). The vascular **system** consists of arteries, veins and capillaries. **Vertebrates** (**animals** with backbones like fish, birds, reptiles, etc.), including most mammals, have closed cardiovascular **systems**.

transport system in vertebrates

What type of circulatory system do vertebrates have?

Vertebrates, and a few invertebrates, **have** a closed **circulatory system**, shown in Figure 2. Closed **circulatory systems** (evolved in echinoderms and **vertebrates**) **have** the blood closed at all times within vessels of different size and wall thickness.

what are the function of kidney

What are the four main functions of the kidneys?

KIDNEYS

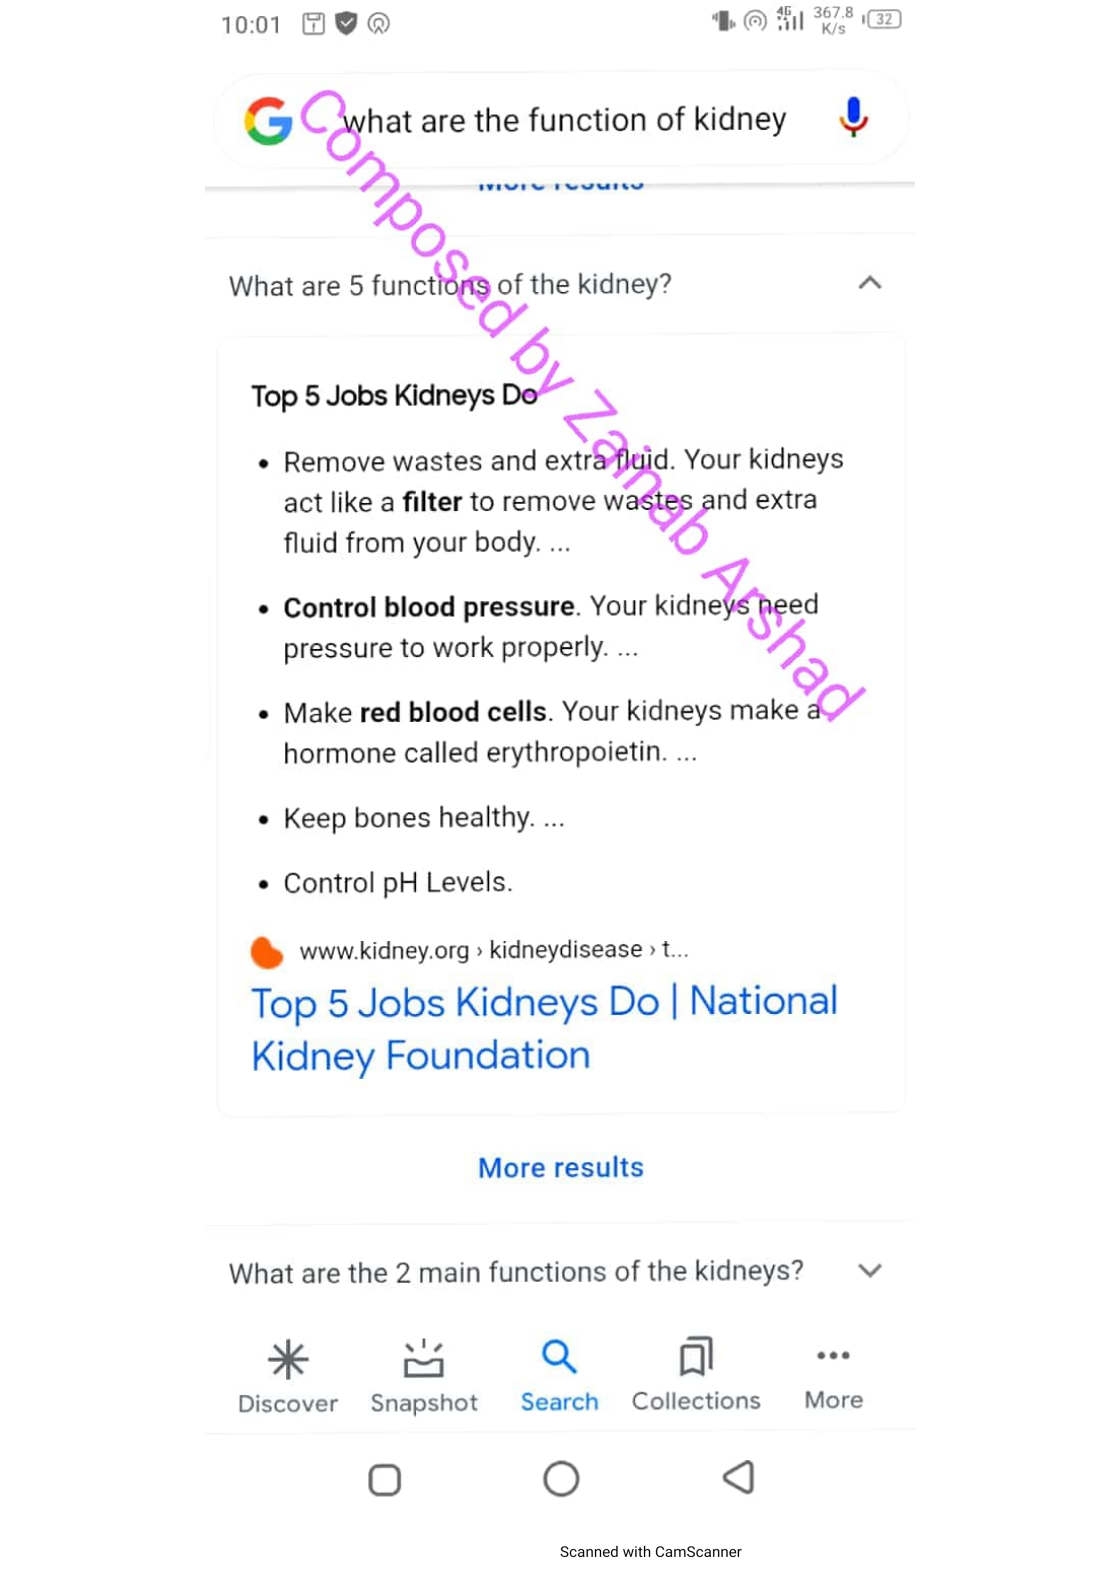

- Regulation of **extracellular fluid volume**. The kidneys work to ensure an adequate quantity of plasma to keep blood flowing to vital organs.
- Regulation of osmolarity. ...
- Regulation of ion concentrations. ...
- Regulation of pH. ...
- **Excretion** of wastes and toxins. ...
- **Production** of hormones.

role of hormones in kidney

ALL IMAGES NEWS VIDEOS MAPS

The **kidney** has multiple endocrine **roles**; it secretes various **hormones** and humoral factors: the **hormones** of the renin- angiotensin system (RAS), erythropoietin (EPO), and 1,25 dihydroxy vitamin D3. It also produces enzymes, such as kallikreins, which produce **hormones** in other, distant sites.

role of chromatin

People also ask

What is the function of chromaffin cells?

A type of cell that makes neurohormones (chemicals that are made by nerve cells and used to send signals to other cells) and releases them into the blood. Chromaffin cells make epinephrine (adrenaline) and norepinephrine (noradrenaline). They are found in the **adrenal glands** or in groups of nerve cells called ganglia.

What are the 2 types of feedback mechanism?

Composed by Zainab Arshadí

There are two types of feedback loops: **positive** and negative. **Positive** feedback amplifies system output, resulting in growth or decline. Negative feedback dampers output, stabilizes the system around an equilibrium point.
