Question # 1 of 10 (Start time: 10:29:36 AM, 16 July 2023) Total Marks: 1

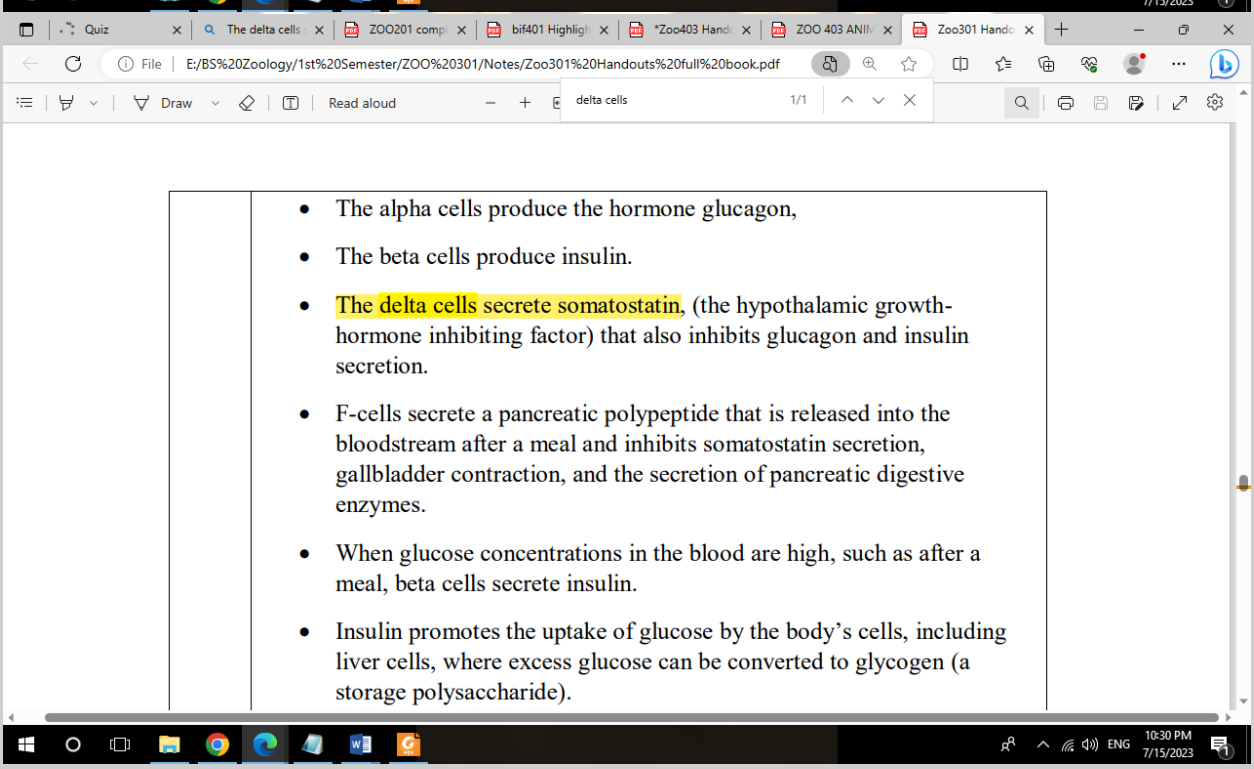

The delta cells secrete ----------.

Select the correct option

Reload Math Equations

- Somatostatin
- ADH
- Thyroxine
- Oxytocin

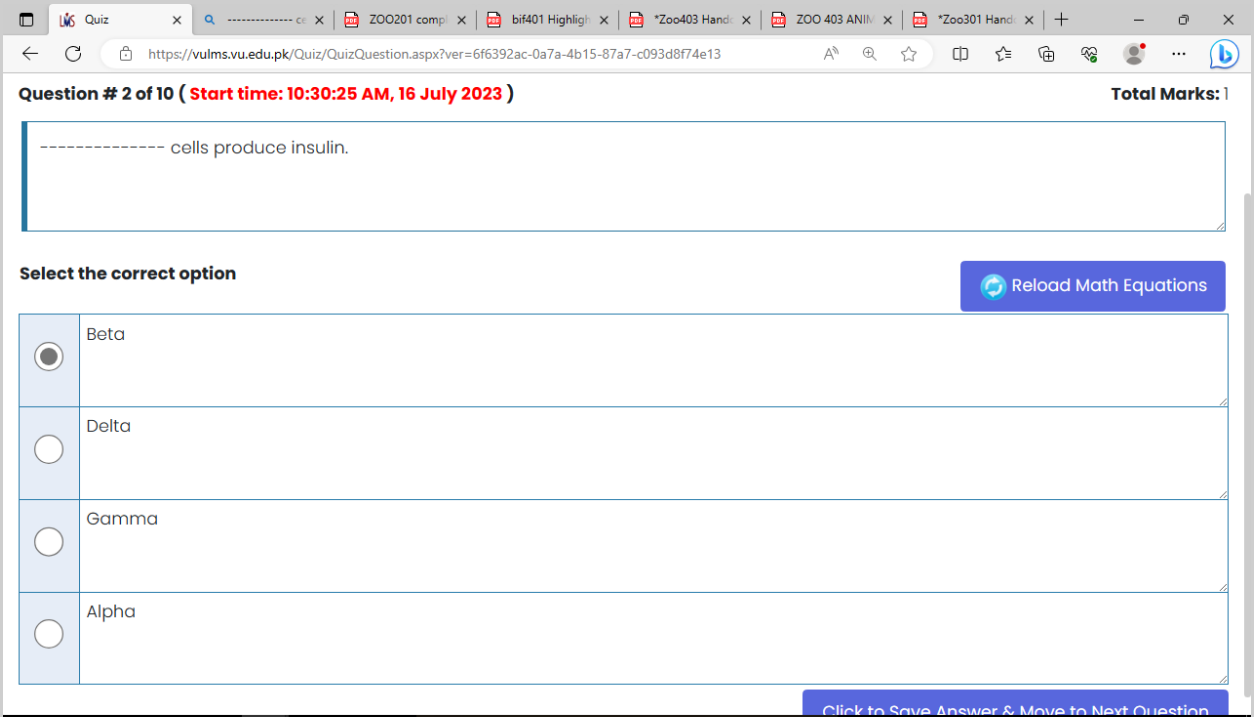

Click to Save Answer & Move to Next Question

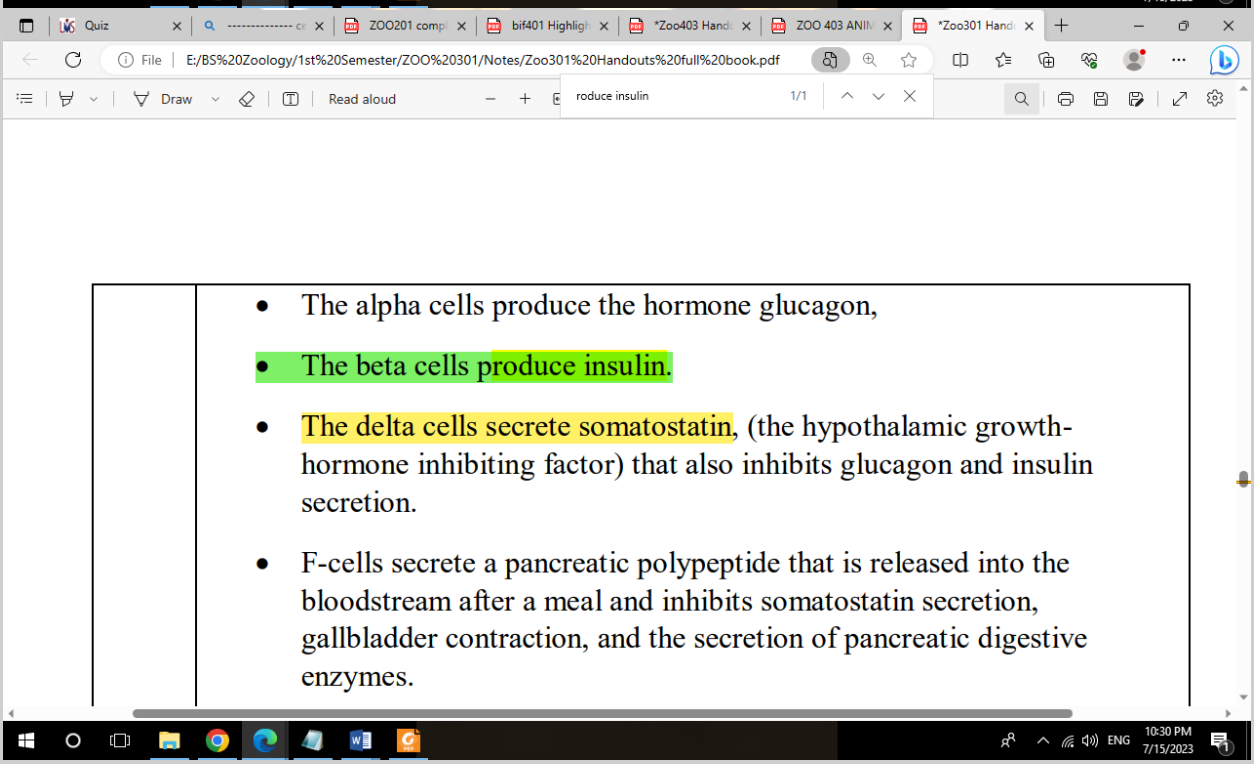

- The alpha cells produce the hormone glucagon,
- The beta cells produce insulin.
- The delta cells secrete somatostatin, (the hypothalamic growth-hormone inhibiting factor) that also inhibits glucagon and insulin secretion.
- F-cells secrete a pancreatic polypeptide that is released into the bloodstream after a meal and inhibits somatostatin secretion, gallbladder contraction, and the secretion of pancreatic digestive enzymes.
- When glucose concentrations in the blood are high, such as after a meal, beta cells secrete insulin.
- Insulin promotes the uptake of glucose by the body's cells, including liver cells, where excess glucose can be converted to glycogen (a storage polysaccharide).

Question # 3 of 10 (Start time: 10:30:48 AM, 16 July 2023) Total Marks: 1

The pineal gland is located behind the ---------- cerebral ventricle in the brain between the two cerebral hemispheres.

Select the correct option

Reload Math Equations

- 3rd
- 2nd
- 4th
- 1st

	• Both ADH and oxytocin are thought to have evolved from a similar ancestral chemical messenger that helped control water loss and, indirectly, solute concentrations.
129	**Pineal Gland:** • The pineal gland is also known as the third eye. • It is an endocrine gland in the Brain. • The pineal gland is located behind the third cerebral ventricle in the brain between the two cerebral hemispheres. • Darkness makes Pineal gland to produce Melatonin. • Melatonin hormone modulates wake/sleep and seasonal changes. • Light inhibits the enzymes needed for melatonin synthesis.

Question # 6 of 10 (Start time: 10:33:05 AM, 16 July 2023) Total Marks: 1

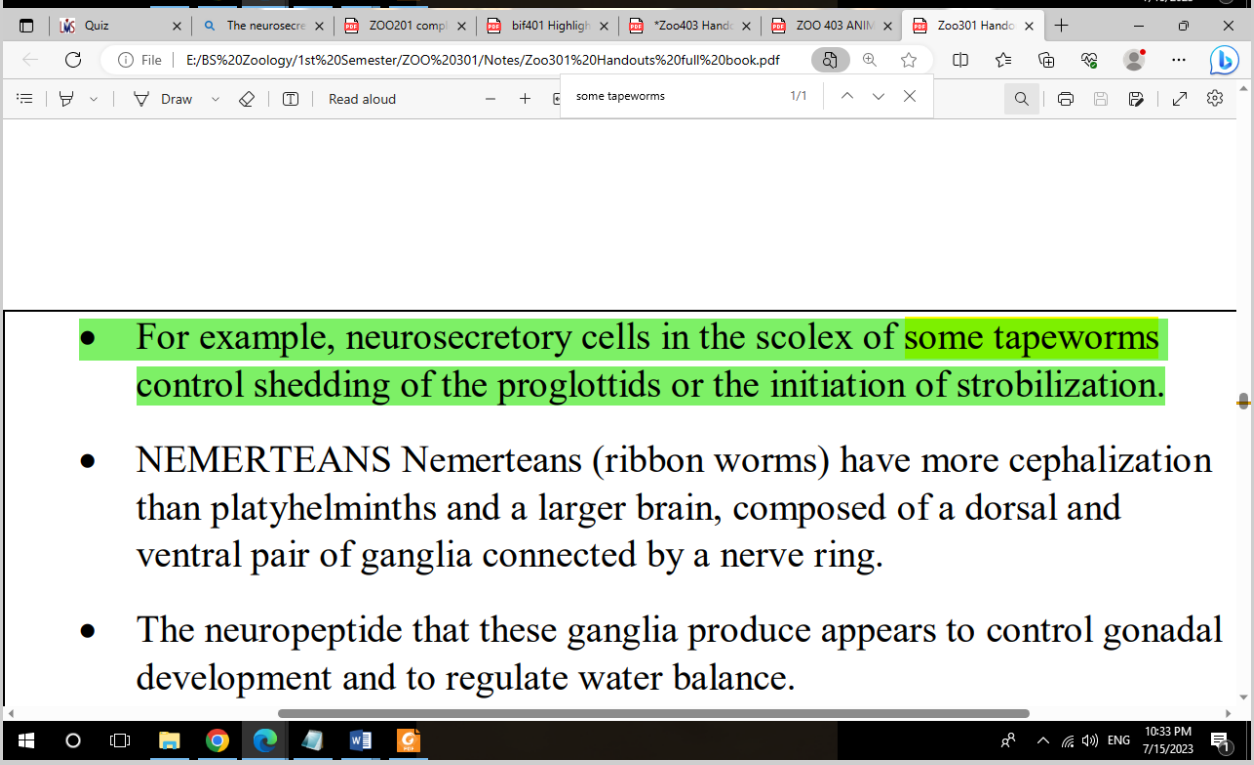

The neurosecretory cells in the _____ of some tapeworms control shedding of the proglottids or the initiation of strobilization.

Select the correct option

Reload Math Equations

- Brain
- Neuropeptides
- Scolex
- Spinal Cord

Click to Save Answer & Move to Next Question

- For example, neurosecretory cells in the scolex of some tapeworms control shedding of the proglottids or the initiation of strobilization.
- NEMERTEANS Nemerteans (ribbon worms) have more cephalization than platyhelminths and a larger brain, composed of a dorsal and ventral pair of ganglia connected by a nerve ring.
- The neuropeptide that these ganglia produce appears to control gonadal development and to regulate water balance.

and permits the body to react strongly and quickly to emergencies.

ancreas (Glucose homeostasis)

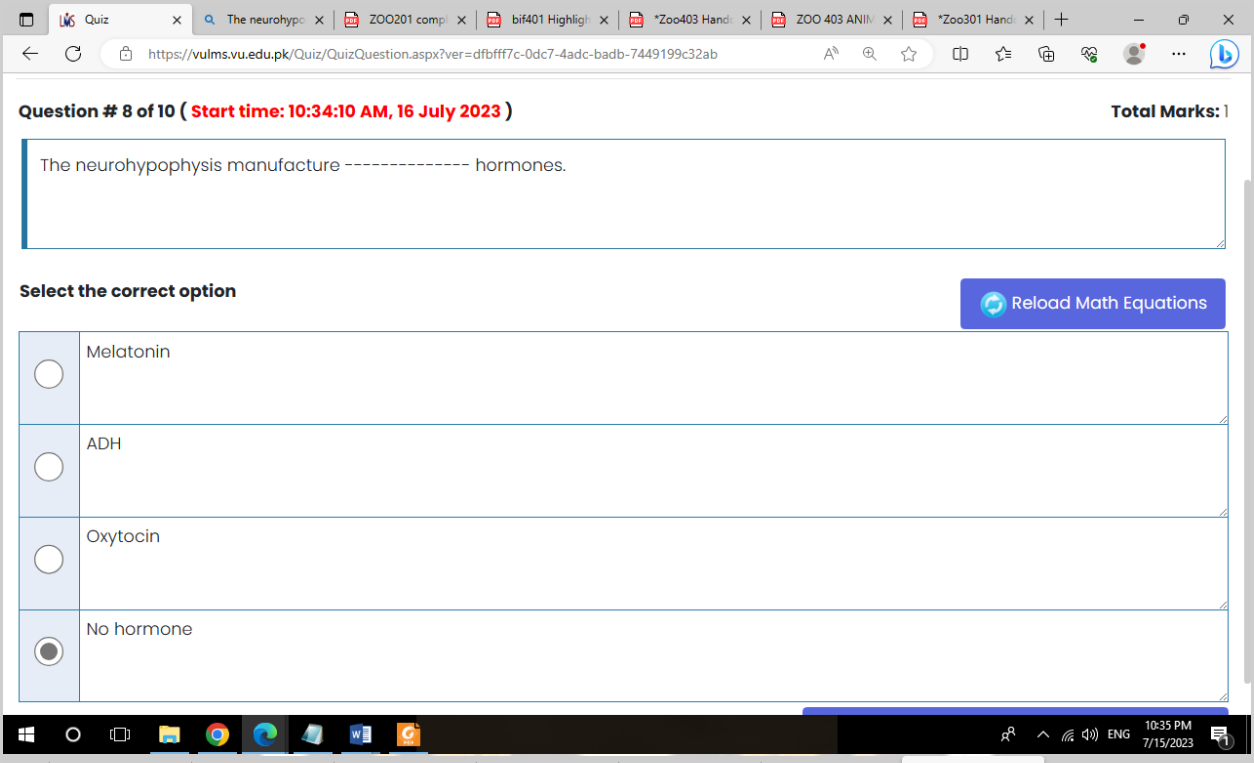

- The pancreas is an elongated, fleshy organ posterior to the stomach.
- It functions both as an exocrine and endocrine gland.
- The endocrine portion of the pancreas makes up only about 1% of the gland.

Question # 8 of 10 (Start time: 10:34:10 AM, 16 July 2023) Total Marks: 1

The neurohypophysis manufacture ---------- hormones.

Select the correct option

Reload Math Equations

- Melatonin
- ADH
- Oxytocin
- No hormone

lormones of Neurohypophysis:

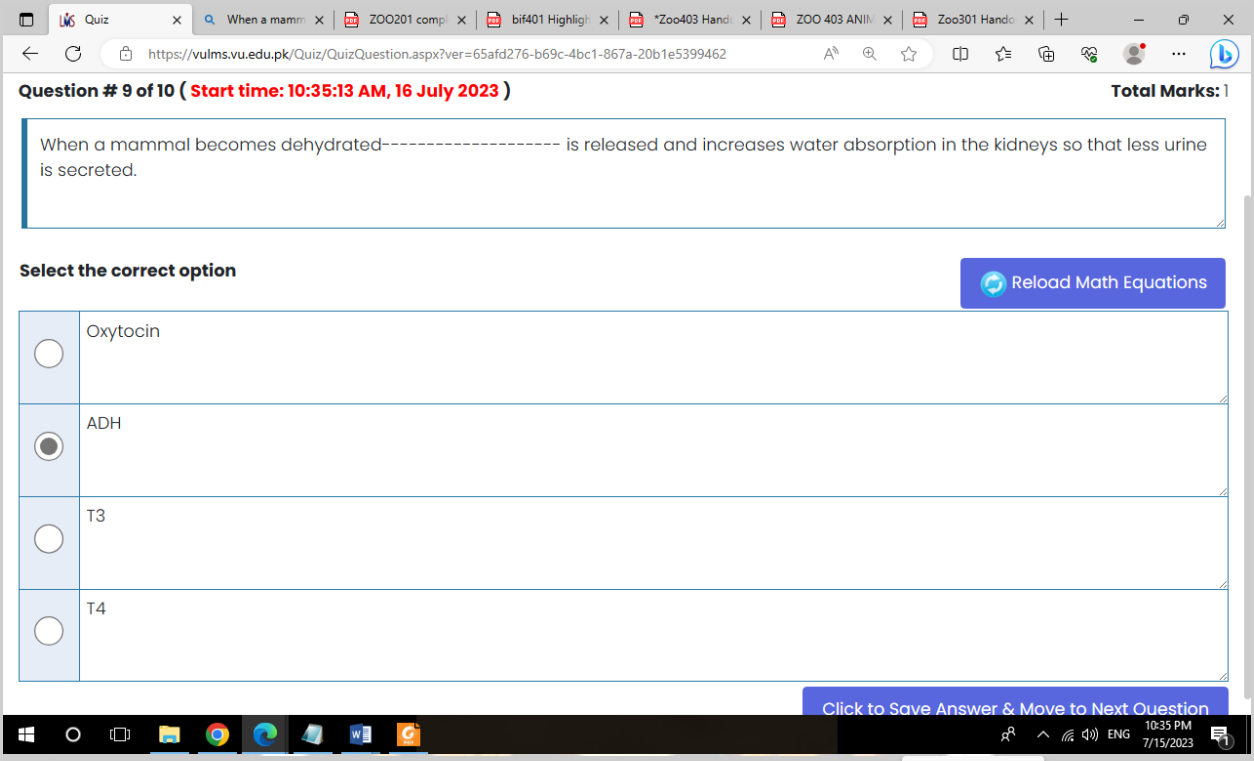

- The neurohypophysis does not manufacture any hormone.
- Instead, the neurosecretory cells of the hypothalamus synthesize and secrete two hormones:

1. Antidiuretic Hormone(ADH) and
2. Oxytocin

- These hormones then move down the nerve axons into the neurohypophysis, where they are stored in the axon terminals until released.

Question # 9 of 10 (Start time: 10:35:13 AM, 16 July 2023) Total Marks: 1

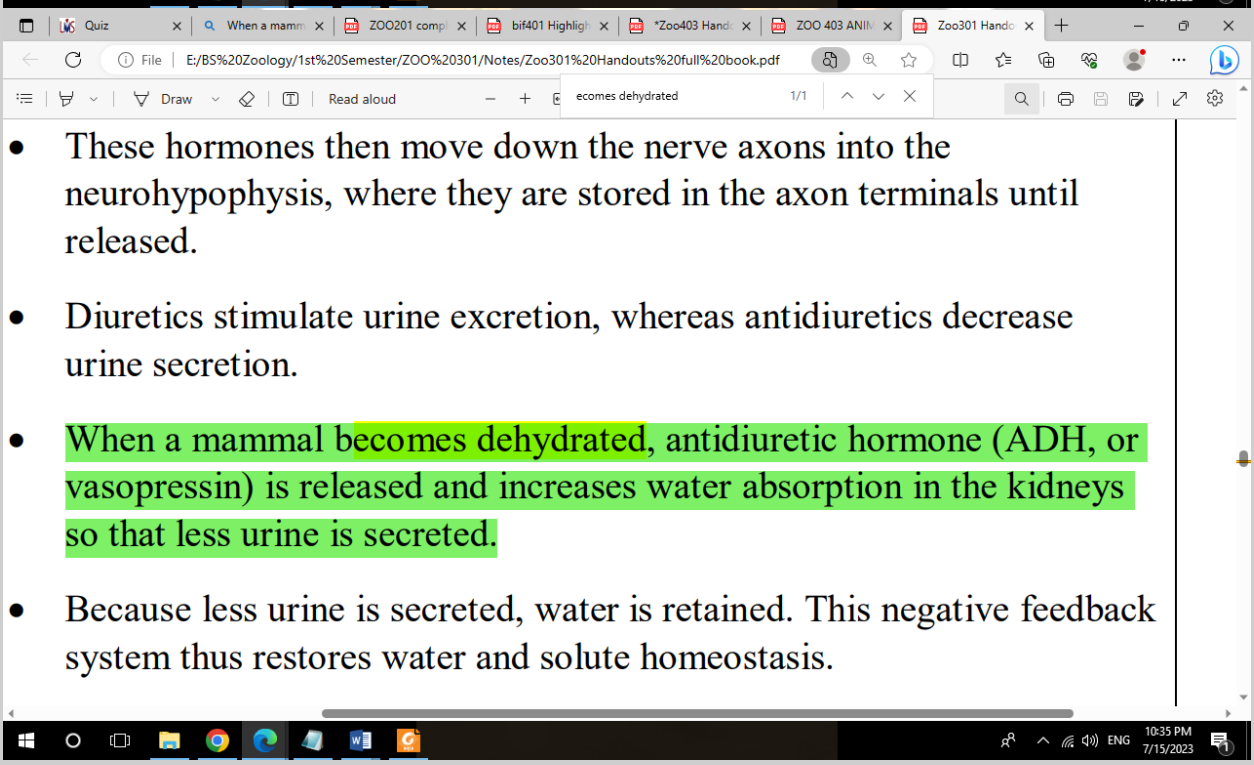

When a mammal becomes dehydrated---------- is released and increases water absorption in the kidneys so that less urine is secreted.

Select the correct option

Reload Math Equations

- Oxytocin
- ADH
- T3
- T4

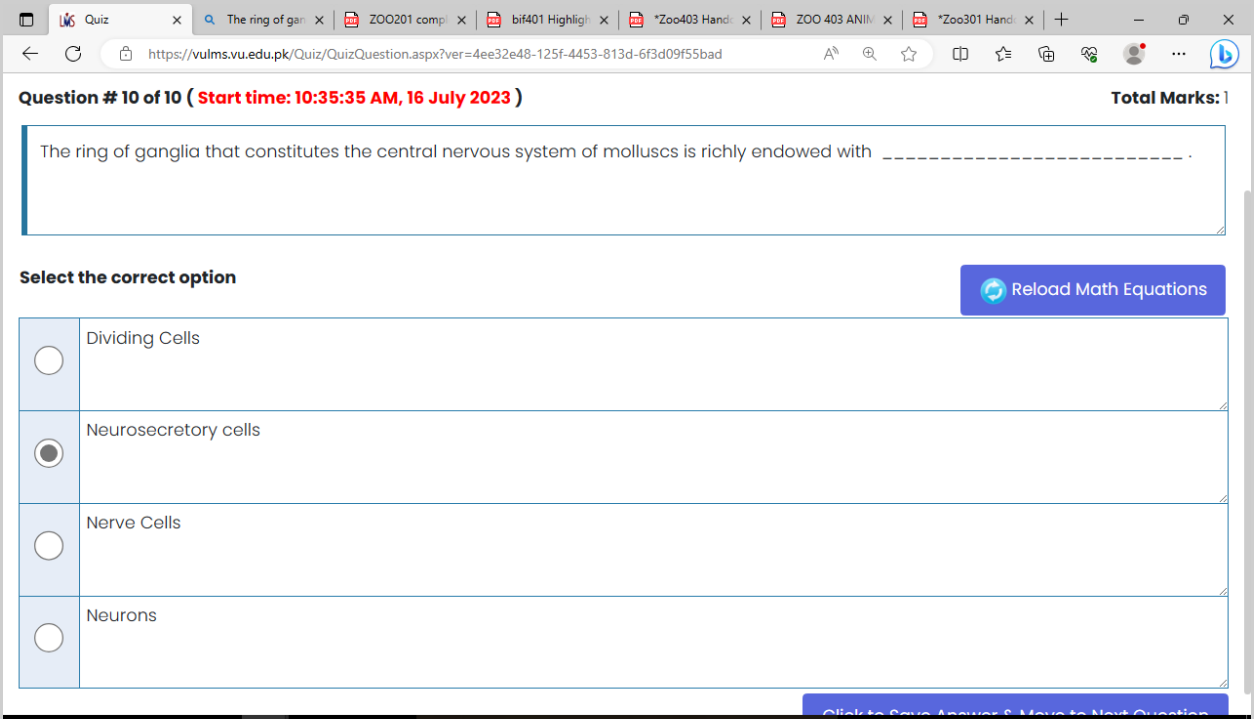

Click to Save Answer & Move to Next Question

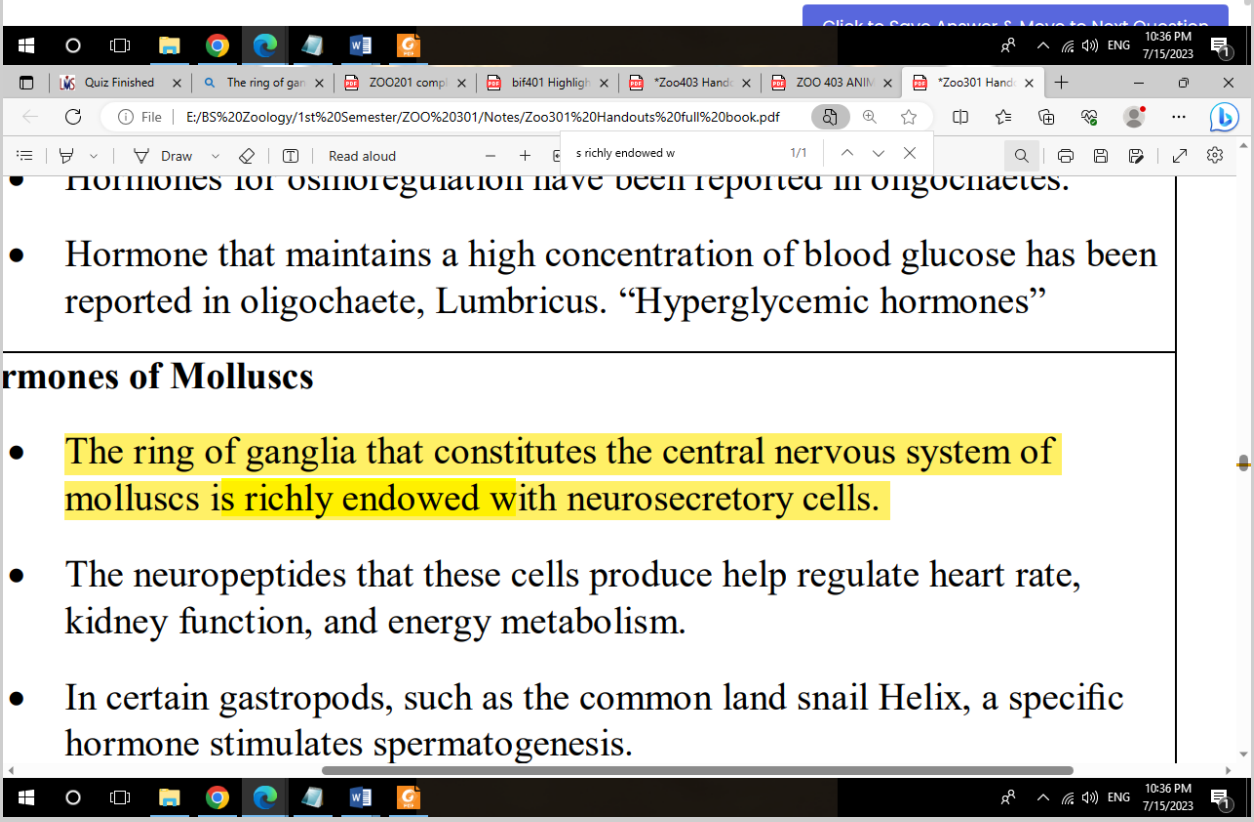

- These hormones then move down the nerve axons into the neurohypophysis, where they are stored in the axon terminals until released.
- Diuretics stimulate urine excretion, whereas antidiuretics decrease urine secretion.
- When a mammal becomes dehydrated, antidiuretic hormone (ADH, or vasopressin) is released and increases water absorption in the kidneys so that less urine is secreted.
- Because less urine is secreted, water is retained. This negative feedback system thus restores water and solute homeostasis.
